PULSE OF THE FASHION INDUSTRY
GLOBAL FASHION AGENDA

Global Fashion Agenda is a global leadership forum on fashion sustainability founded in 2016 and anchored around Copenhagen Fashion Summit, the world’s principal event on sustainability in fashion for industry decision-makers. Global Fashion Agenda advances a year-round mission to mobilize the international fashion industry to transform the way we produce and consume fashion, for a world beyond next season. In partnership with sustainability pioneering industry leaders including Kering, H&M, Target, Li & Fung and Sustainable Apparel Coalition, Global Fashion Agenda sets the agenda for the industry on the most critical environmental, social and ethical issues, and advocates for a collective industry focus on the largest opportunities. Global Fashion Agenda is a not-for-profit initiative. For more information, please visit www.copenhagenfashionsummit.com/global-fashion-agenda

THE BOSTON CONSULTING GROUP

The Boston Consulting Group (BCG) is a global management consulting firm and the world’s leading advisor on business strategy. We partner with clients from the private, public and not-for-profit sectors in all regions to identify their highest-value opportunities. Our customized approach combines deep insight into the dynamics of companies and markets with close collaboration at all levels of the client organization. This ensures that our clients achieve sustainable competitive advantage, build more capable organizations, and secure lasting results. Founded in 1963, BCG is a private company with 85 offices in 48 countries. For more information, please visit www.bcg.com

A Call for Collaboration and Innovation
INTRODUCTION

TOWARDS A VISION OF A BETTER FASHION INDUSTRY

The fashion industry has a clear opportunity to act differently, pursuing profit and growth while also creating new value for society and therefore for the world economy. It comes with an urgent need to place environmental, social, and ethical improvements on management’s agenda.

In recent decades, the fashion industry has been an engine for global development. One of the world’s largest consumer industries,1 generating €1.5 trillion in annual apparel and footwear revenues in 2016,2 it employs around 60 million people along its value chain.3

To continue the growth trajectory, the fashion industry needs to address its environmental and social footprint. The earth’s natural resources are under pressure, and the fashion industry, although not the most obvious contributor, is a considerable one. Social conditions—also in the fashion industry—are far from those set forth in the United Nations’ goals for sustainable development. With current trajectories of production and consumption, these pressures will intensify by 2030 to the point of threatening industry growth itself.

With resources becoming even scarcer, the industry will face rising costs from labor to materials and energy. Based on conservative projections, fashion brands’ profitability levels are at risk in the range of at least 3 percentage points if they don’t act determinedly, and soon.

The facts show a clear need for acting differently. The good news is that by changing practices, the industry can both stop the negative impact and generate a high amount of value for society, while also protecting profitability. We estimate that the world economy would gain about €160 billion annually if the fashion industry would successfully address those environmental and social issues.

As of today, the sustainability ‘pulse’ of the industry is weak. The newly developed global Pulse Score, a health measure for the sector (see page 28 for more details), is only 32 out of 100. The industry is not yet where it could and should be. The spread of performance is also quite large. The best performers on sustainability are the very big players as well as some mid-sized, family owned companies, while over half of the market, mainly small to medium-sized players, has shown little effort so far. The rest of the industry is somewhere in between. This is confirmed by the Pulse Survey (further information on pages 35/36), where two-thirds of polled fashion executives have not made environmental and social factors guiding principles for their companies’ strategy.

Fashion brands with targeted initiatives will be best placed to improve their environmental and social footprint and counteract the rising costs of apparel production. They will pull ahead of their competitors with innovative ways of doing business and efficient production techniques that minimize the use of water, energy, and land, as well as hazardous chemicals. By realizing better working conditions and improving workers’ safety, they will minimize their operational and reputational risks and create significant value for themselves and the world economy. These initiatives will improve the overall industry Pulse, raising the average and creating inspiring best practices for the low performers to learn from.

However, even if the entire industry caught up to the best practice front-runners, it would not be enough. Under optimistic and ambitious assumptions, only less than half of the €160 billion could be captured.4 The industry needs coordinated action beyond today’s solutions. This report explains the size of the challenge and the need for innovation, collaboration and supporting regulatory action to close the gap.

About the report

The authors of this report—The Boston Consulting Group (BCG) and Global Fashion Agenda (GFA)—have developed a common fact base on the health of the industry, and have evaluated and quantified the overall opportunity for sustainability in fashion. GFA and BCG worked in close collaboration with GFA’s strategic partners that have acted as a sounding board, comprising H&M, Kering, Li & Fung, Target, and the Sustainable Apparel Coalition (SAC). Further, the SAC has acted as an exclusive data provider through the Higg Index. BCG has analyzed this data in depth, and has complemented the input to get a representative metric on sustainability in fashion: the Pulse Score.
This first edition of the Report on the Pulse of the Fashion Industry exposes the challenges in a number of sustainability impact areas and along the industry’s value chain, from design and development to end-of-life for apparel and footwear. It aims to provide transparency on the industry’s stance in terms of its environmental, social, and ethical footprints—topics that have been much debated, yet without a common baseline and framework against which to evaluate change. It also reviews ways in which the industry can maintain and even strengthen its profitability despite the pressures of rising costs.

The overarching objective of the report is to provide a direction and guidance towards a better fashion industry. As a starting point, the report provides a common fact base on the current sustainability performance of the industry. Based on that it lays out a Landscape for Change and presents pragmatic, concrete, and economical actions that are already available for producing palpable change. The report promotes collaboration and innovation as main drivers to accelerate change.

**BOLDER LEADERSHIP NEEDED NOW**

What will it take to tackle the changes necessary to improve the industry’s standing—and to safeguard its profitability? First, it is important to acknowledge that many laudable efforts are already being made across the industry. Individually, many companies are striving to optimize business practices. Collectively, too, many initiatives have been launched with the goals of educating consumers, striving for substantial improvements, building broad industry networks dedicated to environmental, social and ethical objectives, and more.

There is no shortage of non-government organizations and private foundations to provide education, incentive, and oversight. There are also working groups, forums, and conventions, with the Global Fashion Agenda’s annual Copenhagen Fashion Summit as the world’s leading event on sustainability in fashion. Much effort has gone to develop transparency indexes as standard supply chain measurement tools, such as the Sustainable Apparel Coalition’s (SAC) Higg Index that is already in use by many companies. These enable all industry participants to understand the environmental and social impacts of making and selling their products and services.

All of these well-staffed and well-thought-out initiatives have helped companies make real progress in sustainability and built a foundation for future improvement. Despite those efforts, the pulse of the industry is weak. Therefore we advocate for a consolidation and realignment of efforts and resources towards high impact levers, with fewer and stronger initiatives. It’s now time to work for the broad commitment necessary to make the extensive, industry-wide changes required. We need to go beyond campaigns driven by single entities that yield incremental results. Individual fashion brands cannot drive major changes on a large scale across value chains, impact areas and geographies. And individual governments cannot set the regulatory framework for a global industry.

We need well-orchestrated, system-wide actions that involve a broad coalition of stakeholders. That requires bold leadership: from fashion businesses in prioritizing, collaborating and committing to actions on critical areas for improvement; from bodies such as NGOs, industry associations, and consortia in coordinating and driving the cross-industry and cross-functional collaboration to propel change; and from regulators in amplifying change with supportive incentives—or in interfering with strong dictates when the industry moves too slowly.

All this is more easily said than done.

There is, however, every possibility that change can happen in a short time. The fashion industry has in-built advantages: the creativity that is its most emblematic trait and the public admiration it continues to enjoy. Supported by disruptive technologies, fashion has the talent, the networks, the funding, and all of the resources it needs to transform itself. Now is the time to start doing things differently.
The fashion industry is highly fragmented, with thousands of actors involved and one of the most complex global production networks and supply chains. There is not a standard path for the cotton produced in one country, spun in another, dyed and processed in a different one and converted into a garment in a factory far away from the store. And often, there is no view of the ‘real cost’ incurred.

It is challenging then to truly gain an understanding of what the critical sustainability issues are and to fully grasp the magnitude of the value at stake.

In fact, there is a lack of reliable facts to guide action. It is not enough to respond to unsubstantiated statements such as “The global fashion industry is the second most polluting industry in the world”. Data and agreed-upon links between cause and effect are what spark ideas, create conviction, and sponsor action. With this report, GFA and BCG intend to start building a frame of reference that transcends misconceptions and for the first time offer a common baseline of facts and ideas, empowering the fashion industry to act.

This chapter provides global environmental and social facts at a glance and looks at how they relate to the fashion industry. It also presents a projection to 2030 that assumes the fashion industry continues on its current trajectory of production and consumption. To highlight the opportunity, we conclude by calculating the value at stake for the world economy and arguments for businesses to start acting now.

2030: 8.5 BILLION PEOPLE WILL REQUIRE CLOTHING

If the global population rises as expected to 8.5 billion people by 2030 and the GDP per capita grows at 2% per year in the developed world and 4% in the developing world, GFA and BCG project that the overall apparel consumption will rise by 63%, from 62 million tons today to 102 million tons in 2030—an equivalent of more than 500 billion T-shirts. Concurrently, soaring demand for apparel—much of it from developing nations—will see the annual retail value of apparel and footwear reach at least €2.0 trillion by 2030 (an over 30% increase of €500 billion between now and then).

We explore below how the growth of the industry—in terms of value and volume—comes with increased environmental and social costs. We consider these mounting costs from the global and the industry perspective.

To gain a sense of the importance of each impact area, GFA and BCG have placed a monetary value on each externality. This enables a transparent illustration of how much value is at stake for the world economy—representing human economic activity, social and natural capital—in a tangible and comprehensive way. In this report we present exemplary evidence for the economic viability of sustainability initiatives. Estimating the full business opportunity for individual companies implementing sustainable practices will be a topic of future editions of the Pulse report. This assessment will be carried out in cooperation with corporate frontrunners on the subject.
The Planetary Boundaries Have Already Been Breached

In 2030, the Planetary Boundaries Will Be Even Further Exceeded

Note: Illustration adapted from UN Environment Programme, Rockström et al. and Steffen et al., representing today’s status.

Exhibit 1 The Planetary Boundaries 2015

The Planetary Boundaries Have Already Been Breached

Exhibit 2 The Planetary Boundaries 2030

In 2030, the Planetary Boundaries Will Be Even Further Exceeded

Exhibit 3 Projected Environmental Impacts

Increasing Fashion Consumption Is Creating Further Environmental Stress

When we look at the planet from the perspective of several planetary boundaries, delimiting an environmentally sustainable safe operating space for humanity, as defined by a group of earth environmental scientists led by researchers from the Stockholm Resilience Center and the Australian National University, it becomes clear that the planet is already facing significant tensions based on human activity. According to these researchers the planet is already beyond its safe operating space in terms of climate change, waste pollution, changes in land use, and biochemical output. (See Exhibit 1.) That means we face increasingly higher risk of destabilizing the state of the planet, which would result in sudden and irreversible environmental changes with potentially large damaging impact on the world economy.

Although the harm is, of course, not all due to the fashion industry, the industry’s present linear business model is an obvious contributor to stress on natural resources.

If production and consumption of apparel and footwear follow their current trajectories, increasing by another 63%, fashion’s environmental footprint will continue to contribute to the negative impacts on the planet. (See Exhibit 3.)

The additional strain of an expanding environmental footprint can be observed on a number of impact areas, specifically water use, CO₂ emissions, use of chemicals, and generation and disposal of waste.

Given that the natural resources of the planet are already burdened, the projected increase in the industry’s environmental footprint will exacerbate the situation. (See Exhibit 2.) In the worst case, the fashion industry will face distinct restrictions on one or more of its key input factors, leaving it unable to grow at the projected rate and in the long run unable to continue under its current operating model.

To understand the magnitude, context, and opportunities related to each area of environmental impact, it is useful to look at each in more detail.
Although on average, global freshwater use has not yet exceeded its planetary boundary, freshwater access is unevenly distributed across the planet. Certain areas of the world (e.g., North Africa, the Middle East, and South Asia) already live in a state of near-permanent water stress. The volume consumed by the fashion industry today is already large with nearly 79 billion cubic meters—enough to fill nearly 32 million Olympic-size swimming pools. GFA and BCG anticipate that water use will increase by nearly 50% by 2030, which is critical, because some of the main cotton-producing countries such as China and India are located in areas that are already suffering from high or medium to high levels of water stress. Those levels are projected to become even more severe, as the shortfall between demand and supply of water is projected to reach 40% by 2030. Thus, as water scarcity becomes more extreme, cotton-growing nations and the fashion industry may face the dilemma of choosing between cotton production and securing clean drinking water.

Estimating the value for the world economy (see Impact Area Overview on page 21/22 for more detail) of the 39 billion additional cubic meters expected to be consumed annually by 2030 results in €32 billion at stake per year. That is the potential benefit to the world economy if the fashion industry can find ways to consume no more water than it does today. The most significant water use occurs during the production of raw materials—notably in cotton cultivation—but many aspects of textile processing are also water intensive. Additionally, consumers are responsible for further consumption as they wash their clothes.

Energy Emissions
The level of atmospheric CO₂ already today exceeds by about 20% what is considered safe, according to the latest earth system research. The industry’s CO₂ emissions are projected to increase by more than 60% to nearly 2.8 billion tons per year by 2030—the equivalent of emissions produced by nearly 230 million passenger vehicles driven for a year, assuming average driving patterns. The value opportunity at stake to the world economy of improved energy management in the fashion industry is the largest in magnitude across all impact areas with €67 billion, representing effects such as shifting climate patterns. Because some of the fashion sector’s primary manufacturing locations are particularly vulnerable to climate change and rising sea levels, large benefits can be reaped for both the world economy and the suppliers to the fashion industry. The industry’s greatest impacts on the climate is from processing, followed by the use of apparel and the production of raw materials.

Chemicals Usage
The level of bio-chemical flows, represented by the flow of phosphorus from fertilizers to erodible soils, already exceeds the safe operating space by more than 220%. Through cotton production, the fashion industry is a large user of fertilizers, with cotton consuming 4% of nitrogen fertilizers and phosphorous globally. Excessive use of fertilizers can lead to runoff from the land into waterways. The negative effects include algal blooms depleting oxygen in the water. Further, although the cultivation area of cotton covers only 3% of the planet’s agricultural land, its production consumes an estimated 16% of all insecticides and 7% of all herbicides. Finally, organic and inorganic toxic substances (such as mercury and arsenic) discharged to waterways from processing plants damage the environment. The impacts to human health of water pollution include toxicins building up in the body, possibly leading to cancers, acute illnesses, or other conditions.

To approximate the monetary impact, these effects are tied to occupational illnesses attributed to carcinogens and airborne particulates (see Impact Area Overview for details, page 21/22). By eliminating such health impacts due to poor chemical management by 2030, an annual value of around €7 billion can be gained.

Waste Creation
Today, humankind produces 2.1 billion tons of waste per year. In terms of annual ecological footprint, the world’s population already produces more than 1.6 times what the earth can absorb in the same time frame. Assuming today’s current solid waste during production and at end-of-use, the industry’s waste will increase by about 60% between 2015 and 2030, with an additional new 57 million tons of waste generated annually. This brings the total level of fashion waste in 2030 to 148 million tons—equivalent to annual waste of 17.5 kg per capita across the planet. The vast majority of clothing waste ends up in landfills or is incinerated; globally, only 20% of clothing is collected for reuse or recycling.

A large opportunity for value creation awaits the world economy if the fashion industry manages to convert textile waste into raw materials through the use of advanced recycling techniques (discussed in more depth in chapter 3). But this type of recycling technology is not yet available for a broad range of fibers and it has yet to be proved economically viable at scale. Therefore, the current value is based on pure waste reduction along a linear value chain. Consequently, the opportunity to the world economy is modest at around €4 billion per year in 2030—although under a circular model of production and consumption, this value would be manifold higher.

THE FASHION INDUSTRY WILL FACE RESTRICTIONS ON ONE OR MORE OF ITS KEY INPUT FACTORS, RISKING GROWTH AT THE PROJECTED RATE
34% of the total employment in manufacturing across key Asian production countries.

Over 50% of workers are not paid the minimum wage in countries like India or the Philippines.

Minimum wages in the industry are 1/2 of what can be considered a living wage.

Non-compliance to minimum wages can be as high as 87%.

For women, while it is 27% for men in Pakistan.

60-80% share of exports in countries such as Bangladesh or Cambodia.

Companies on avg. spend 0.2% of sales on community spending, while the UN proposes 0.7% in its development goals.

The industry has on avg. 5.6 injuries per 100 workers per year, while in suppliers’ factories of a large sports goods manufacturer number is only 2.5.
try42 and 26 million of those employed upstream, 43 the fashion industry ating space by 17%.38,39 By 2030, it is predicted that the fashion industry including land intended for cotton cultivation, has exceeded the safe oper-
tensive inputs. The scarcity of arable land might lead to higher cost of land raw materials on land use and to shift the material mix toward less land-in-
is a strong incentive for the fashion industry to consider the impact of its with the case of water, will result in the dilemma of whether to produce increase in agricultural production in order to feed everyone, 41 which, as grow crops for an increasing and more demanding population or to pre-
appropriate for the fashion industry to consider the impact of its raw materials on land use and to shift the material mix toward less land-in-
tensive inputs. The scarcity of arable land might lead to higher cost of land or even restricted access for non-food crops in the future.

**SOCIAl PRESSURES PUTTING €50BN VALUE AT STAKE**

With approximately 60 million people employed in the fashion industry 42 and 26 million of those employed upstream, 43 the fashion industry has an opportunity to create large-scale social change for millions. It pro-
vides employment for roughly every third manufacturing worker across key Asian production countries 44 and is a key driver of economic growth, accounting for as much as 80% of merchandise exports in Bangladesh and 66% in Cambodia. 45 For instance, the mandate for the fashion industry to drive positive improvements becomes very apparent. (See Exhibit 4.)

The growth in apparel consumption will also leave its mark along sev-
eral social impact areas, specifically labor practices, health and safety, and community and external engagement. (See Exhibit 5.) In the following, each impact area is addressed in more detail—in terms of both social pres-
sures and opportunities.
THERE IS A €160 BILLION-PER-YEAR UPSIDE FOR THE WORLD ECONOMY ROUGHLY 11% OF THE CURRENT RETAIL VALUE OF THE GLOBAL APPAREL AND FOOTWEAR SECTOR
the number of recorded injuries in the industry is projected to reach 1.6 million by 2030 compared to 1.4 million today. The increase in the total number of injuries is modest at 7%. This is attributed to a decreasing trend as the industry is already striving to provide a safer working environment. Nevertheless, there is room for improvement when comparing the 2015 average industry recordable injury rate of 5.6 with that of industry front-runners—for instance Nike, with a recordable injury rate of 2.5 for 2015.

More than €32 billion a year can be reclaimed if the fashion industry were to succeed in preventing all workplace injuries (see Impact Area Overview on page 21/22 for details).

Community and External Engagement

Finally, it is worthwhile to compare the fashion industry’s community spending levels with a few global benchmarks. The UN Millennium Development Goals stipulate that the governments of the world’s wealthy countries should commit 0.7% of their gross national product to official development assistance to developing countries—a goal reaching back to the 1970s. While nations and companies may not be directly comparable, it is interesting to note that fashion brands spend on average only around 0.2% of sales on community spending and other Corporate Social Responsibility-related activities. This is on a par with spending in the consumer electronics industry but lags far behind mining and pharmaceuticals, with averages of 0.4% and 1.2%, respectively.

If brands across the industry were to commit to increase spending to 0.7% (in line with UN goals) from 0.2% of sales, there is an annual value to be gained of approximately €14 billion in 2030.

In summary, GFA and BCG contend that there is a €160 billion-per-year upside for the world economy that can be realized through more efficient and diligent use of scarce resources, by treating workers fairly, and by making progress on a range of issues up and down the value chain (see Exhibit 6 on page 20 and Impact Area Overview on page 21/22 for a summary). This is equal to roughly 11% of the current retail value of the global apparel and footwear sector or 90% of its current profit pool.

In addition to the environmental and social impact areas mentioned above, there is an ethical facet to a sustainable fashion industry. While we do not review in detail the ethical dimension in this first edition of the Pulse Report, it is by no means a trivial topic. The ethical dimension tackles challenging topics such as animal welfare, loss of biodiversity, corruption, and negative imagery—such as inadvertently pressuring girls and young women to live up to body ideals that might lead to eating disorders. These ethical reflections are important for the fashion industry to consider and are deemed to be a focus area in future issues of the report.

WHAT IS AT STAKE FOR BUSINESSES?

For businesses, acting differently than today and pursuing novel solutions offer an opportunity to maintain and ensure profitable growth going forward.

If no action is taken, fashion brands will find themselves likely squeezed between falling average per-item prices, deeper discount levels, rising costs, and resource scarcity along the value chain. Indeed, the sector today is built on a linear ‘one-way street’ of take, make, and waste: take, with raw material inputs that are becoming more expensive; make, with labor costing more and more; and waste, with value lost as clothing ends up in landfills.
### Impact Area Overview

The value per unit represents the monetary value to the world economy of one unit of the indicated proxy. The overall value at stake represents the yearly total monetary value to the world economy at risk by 2030 if the fashion industry continues business as usual.

#### WATER

- **Chosen proxy**
  - Water consumption (billion cubic meters)
  - **Value per unit**
    - Projected overall value at stake by 2030: €32 billion per year
    - €0.81/m³

- **Value per ton of waste**
  - Represents the cost to the world economy per worker injury, representing such effects as shorter healthy life expectancy, risk of premature death due to occupational hazards, and inability to provide for the worker's family.

- **Value per worker**
  - Represents the opportunity to the world economy of increased economic consumption and increased private investments.

#### ENERGY

- **Chosen proxy**
  - Emissions of CO₂-eq. (million tons)
  - **Value per unit**
    - Projected overall value at stake by 2030: €67 billion per year
    - €32 billion per year

- **Value per injury**
  - Represents the current value is therefore based on pure waste reduction along a linear value chain.

- **Value per worker**
  - The value per worker represents the opportunity to the world economy of increased economic consumption and increased private investments.

#### CHEMICALS

- **Chosen proxy**
  - Pulse Score in chemicals (% achieved)
  - **Value per injury**
    - Projected overall value at stake by 2030: €7 billion per year
    - €143/DALY

- **Value per worker**
  - Represents the current value is therefore based on pure waste reduction along a linear value chain.

#### WASTE

- **Chosen proxy**
  - Amount of waste (million tons)
  - **Value per unit**
    - Projected overall value at stake by 2030: €4 billion per year
    - €66/t

- **Value per injury**
  - Represents the current value is therefore based on pure waste reduction along a linear value chain.

- **Value per worker**
  - Represents the current value is therefore based on pure waste reduction along a linear value chain.

### PRACTICES

#### COMMUNITY & EXTERNAL ENGAGEMENT

- **Chosen proxy**
  - Foregone community spending (in billion €)
  - **Value per unit**
    - Projected overall value at stake by 2030: €14 billion per year
    - €1.5/€1 spent

- **Value per worker**
  - Represents the current value is therefore based on pure waste reduction along a linear value chain.

### ETHICAL PRACTICES

As the ethical impact area comprises many, vastly different topics, representing it with a single proxy would go too short, even more so than in other impact areas. Furthermore, the overall value of many ethical issues can hardly be represented by monetary values based on currently available research and methodologies. Further, available monetary estimates for single topics lack comparability to the fashion industry and/or do not allow for a delimited consideration of the industry's impacts. We therefore decided to exclude this impact area in this type of analysis.
Between now and 2030, the industry’s labor costs are expected to continue to outpace growth in retail value. While retail value is projected to grow at 2% annually, the cost of labor in large garment-producing countries is expected to grow at least 4% and as much as 5% a year. While this is a positive development for the industry’s workers and supported by many brands, it does increase the pressure on fashion brands’ profitability.

While cotton prices have been projected to remain relatively stable at a projected real annual growth of 1%, we would assume that figure could increase given increasing water scarcity worldwide and how it might affect the cost of future cotton production. Energy prices are projected to increase steadily, with annual growth of at least 2.3% to as much as 3.5% over the same period. While energy is estimated to account for 6% to 10% of production and material costs, the greatest cost impact of energy prices is contributed by the close correlation between oil prices and the price of polyester.

The consequences for fashion brands are at hand: even if base-case projections are used for growth in energy prices and in wages, GFA and BCG project that, by 2030, fashion brands will see a decline in EBIT margins of more than 3 percentage points if they continue ‘business as usual.’

If energy, water prices, and labor costs grow strongly, the industry’s profitability will be under even more pressure. Factoring in the negative externalities of increased water use (such as health impacts from water deficiency) in the price of water puts another 2 percentage points of fashion brands’ margins at risk. The high-case assumption for labor costs adds another 2 percentage points and the same assumption for energy costs inflates that figure by an additional 9 percentage points.

Through investments in water, energy, and waste efficiency as well as labor productivity already feasible today, fashion brands will be able to counteract in a lasting manner several of those percentage points due to the cost pressures outlined above. As this report will show, there is a viable business case for environmental and social measures. The report also lays out the Landscape for Change and highlights the economic viability of robust, committed, long-term initiatives.

There are good reasons to consider the possibility of still higher costs. Wages may rise faster in the fashion sector than in other industries as the industry draws more public attention for its environmental impact and its low minimum wage compliance. Also, oil prices may rise faster than anticipated—particularly should strife in the Middle East expand or Venezuela experiences an economic collapse. In addition, governments may up prices on increasingly scarce water.

GFA AND BCG PROJECT THAT, BY 2030, FASHION BRANDS WILL SEE A DECLINE IN EBIT MARGINS OF MORE THAN 3 PERCENTAGE POINTS IF THEY CONTINUE BUSINESS–AS–USUAL
Worldwide, the fashion industry does not perform well on sustainability. Its overall pulse is weak, with a score of just 32 out of 100, and some dimensions are far below that figure. This chapter takes the pulse along two dimensions: 1) the overall fashion value chain, from design to disposal; and 2) eight impact areas, from water use and carbon footprint to labor conditions and ethical stance.

GFA and BCG analyze, for the first time, the detailed data from the Sustainable Apparel Coalition’s Higg Index—the industry’s self-assessment tool for environmental and social impacts throughout the supply chain. We complemented the Higg Index results with a survey of industry executives (the Pulse Survey), as well as with multiple interviews with experts, to arrive at an overall Pulse Score for the entire global fashion industry.

PERFORMANCE GAPS ACROSS SEGMENTS, VALUE CHAIN STAGES AND IMPACT AREAS

The Pulse is not uniformly weak across the fashion industry. There is a considerable gap in sustainability performance by segment and company. The clear driver of sustainability is company size, not price positioning. So the largest enterprises and a few sustainability-focused niche players are most advanced, while small and midsize companies, which together account for more than half of the industry, rate lowest. (See Exhibit 8.) These low-rating entities are a blind spot in addressing sustainability. Companies in the top revenue quartile have an average Pulse Score of 63, while bottom-quartile contenders are at 11.

Not surprisingly, the Pulse Survey showed executives of large fashion brands indicating a stronger commitment of funds, head count, and other resources to progress toward sustainability than those from small companies. (See Exhibit 9.) Projections show the same pattern.

Small brands constituting around half of the industry, are lacking the knowledge and resources to significantly improve their footprint. They also have little control over and transparency along their supply chains. Even when their intent is good, they lack the critical reach to effect change.

THE FASHION INDUSTRY DOES NOT PERFORM WELL ON SUSTAINABILITY, WITH A PULSE SCORE OF ONLY 32 OUT OF 100
About the Higg Index

WHY A PULSE SCORE?

The Pulse Score is a global and holistic baseline of sustainability performance in the fashion sector. It is based on Sustainable Apparel Coalition’s proprietary Higg Index and extends its scope to extrapolate its findings to the entire industry. The Higg index is the most extensive and representative existing transparency measurement tool of the industry. It covers the majority of large companies and was extended to gain a view on currently underrepresented small to medium-sized players.

Gaining full transparency on the sustainability level of the industry as a whole is important because it gives the industry a common understanding of what the most critical issues across the value chain and by impact areas are. Perhaps more important, it creates a foundation for the landscape for change, channeling investment and innovation into those areas that smart businesses will capture and benefit from.

As the Pulse report will be released annually, the Pulse Score further allows tracking the progress of the industry over time.

METHODOLOGY

The Pulse Score was developed based on:

SAC Higg Index Brand Module as underlying data set source, clustered into segments to detect patterns

And complemented by:

1. Expert interviews going through Higg Index Brand Module questions to test patterns and validate answers live with Sustainability Managers
2. Pulse Survey answers to reconfirm sustainability patterns and performance to increase sample size and fair market representation further
3. Expert sounding board to validate and discuss results

To get a representative view of the entire market, results were analyzed by company size and price positioning and reweighted according to the overall market structure based on revenue contribution.

THE PULSE SCORE

The Pulse is a performance score for measuring and tracking the sustainability of the global fashion industry on key environmental and social impact areas. By design it is impossible to achieve a score of 100 on sustainability, as this is intended to be aspirational.

Overall, the Pulse Score of the fashion industry is:

32 / 100

Measured on a scale from

Weak

1 20-29

Strong

The report reveals that so-called ‘fast fashion’ does not automatically represent a threat to the environment and the world economy. At least the large high-street players score consistently higher than most of the market. Many large entry-price high-street and sportswear brands achieve strong Pulse Scores, as do the small ‘sustainability champions’. But most small and mid-size premium brands show scores in the midfield.

The premium/luxury segment in the Pulse Score analyses comprises a broad selection of players from ‘upper middle premium bridge’ to high-end luxury. Large luxury conglomerates show strong performance, thanks among other reasons to better labor conditions at their production sites, located mostly in higher-wage European countries.

The data indicates that family-owned brands are taking a stronger leadership role, as public companies are more likely to follow shareholders’ expectations for short-term value maximization. Yet we can learn from the positive examples of some listed front-runner companies with credible activities.

### PERFORMANCE DIFFERENCES ALONG THE VALUE CHAIN

Pulse Scores also differ along the value chain. (See Exhibit 10.) The end-of-use and raw material stages are at an average score of 9 and 17, respectively, while design and development is little better at 22. Processing and transportation are the highest at 38 and 41. Some stages may enjoy better scores because their solutions are manageable for the company.
by itself, while improvements at stages such as end-of-use require broad collaboration and scaled-up initiatives. There are substantial gaps in performance between top- and bottom-quartile companies in most stages. The gap is biggest in transportation, with a 50-point difference, and in raw materials and manufacturing, which both show a gap of 45 points. These are stages of low-hanging-fruit for sustainability, where leaders have shown what is possible.

Other stages such as consumer use, where all companies did poorly (only a 10-point gap), require greater attention and a collective push forward. As the survey confirmed, firms are committing far less funds, head count, or other resources to stages at the beginning and the end of the value chain and are currently not planning to do so in the future.

GAPS BY IMPACT AREA

We see further gaps and imbalances when we look across areas of impact. (See Exhibit 11.) Brands are more likely to return higher scores in areas like health and safety, which are regularly in the media spotlight and, especially in Europe, under regulatory scrutiny. Chemical use, subject to the EU’s REACH (Registration, Evaluation, Authorization and restriction of Chemicals) laws, also delivers higher scores for many fashion brands: a Pulse Score of 37. But waste management and water management, which get much less consumer attention, are at only 20. If we examine impact areas by revenue quartiles, the trends are much the same. Energy shows the biggest gap, at 58 points, while waste – where the top quartile is at a mediocre 24, shows a difference of only 12 points.

THE REALITY AS EXPERIENCED BY FASHION SUSTAINABILITY PROFESSIONALS

STATUS QUO

Half of companies have extensive sustainability target setting – nearly all participants have at least a few targets

“Are there sustainability related company targets (such as reduction of CO2 emissions by x% by 2020 or at least x% of suppliers meeting specific labor standards by 2018)?”

14% No, there are no sustainability company targets
35% Yes, but only a few sustainability company targets exist
56% Yes, multiple sustainability company targets exist (more than five)

Integration of targets into business steering is, however, limited...

“Which stakeholder groups are most influential in shaping your company’s sustainability strategy?”

Consumers
Investor/Shareholders
Industry Associations
Government/policy makers / regulators
Brands / Retail
Suppliers
Employees
Competition
Local/Communities affected by operations

“Which share of your revenue is currently achieved with products explicitly marketed as sustainable?”

<1% 1-5% 5-10% 10-25% 25-50% >50% I don’t know

Not currently used
1% 2% 3% 4% 5% 6% I don’t know

Not currently used
<1% 1-5% 5-10% 10-25% 25-50% >50% I don’t know

Respondents say status quo mainly influenced by regulators, with senior management ranking after NGOs

“Which share of your revenue is currently achieved with products explicitly marketed as sustainable?”

“Which share of your volume is made of sustainable materials (e.g., organic, recycled, re-generated, fair trade, BCI, Tencel)?”

Respondents were asked to select from five sustainability factors, percentages show share of top 5 responses.

PATH TO CHANGE

“Who would you attribute the major responsibility for driving the industry towards more sustainability?”

“Which share of your revenue is currently achieved with products explicitly marketed as sustainable?”

Participants final remarks

“We strongly believe that now is the time for the industry to act collectively and not just commit to best practice like DEI Index or the ZDHC MRSL and Wastewater Guidelines. However while most brands and retailers would support such a statement, the adoption of commonly developed tools by brands and retailers is often slow, leading to confusion and double efforts in the supply chain.”

“Building a Sustainable Business is a market share game where only Sustainable Businesses can survive. Why this is a Sustainable World and a Sustainable World can only contain Sustainable Businesses.”

“The managers were asked about the integration of sustainability topics in their organization and its sustainability strategy as a whole, and queried about specific topics affecting impact areas and value chain steps. Additionally, their views were sought on which barriers prevent progress and which stakeholders should take responsibility. The respondents were also invited to share their perspectives on the best ways to advance the industry’s standing on sustainability.”

“Sustainability is no longer optional – it is a must.”

“By joining forces and that increased pressure from international political level will be needed, together with a commercial ‘understandable project’ like a yearly ‘TextileStewardship’ partnership or ‘Environmental Brand Award’ project to put focus on the problems we are facing right now and not only in the future.”

“Believe that the companies’ risk-averse attitude to invest in new technologies and research will separate frontrunners from the others that get left behind.”

“Consumers willingness to pay a premium for sustainable products...”

4. Participants were asked to choose their top 5 barriers, percentages show share of top 25 reasons given.

EXAMINING THE PULSE FROM DESIGN TO END-OF-USE

To help the industry break through its environmental, social, and ethical challenges, this report assesses the industry’s level of sustainability at each value chain step and identifies key issues. (See Exhibit 12.) It also calls attention to the eight impact areas chosen for this report. (See Exhibit 13.) This assessment draws on GFA’s and BCG’s proprietary analyses of the Pulse Score and the Pulse Survey.

In the design and development phase, brands can reduce lifecycle impacts by considering the footprint of proposed garments upfront. (See Exhibit 14.) Designs, especially the choice of raw materials, determine much of a garment’s destiny and impact. The fiber mix of a garment can impede or facilitate recycling, while the colors and prints will limit the options for dyes and process chemicals.

The design function in fashion brands has to overcome two challenges. One is the lack of awareness of their influence on the environmental and social footprint, which goes hand in hand with the absence of tools to assess their impact. The other is many brands’ tendency to ‘design to cost’, letting immediate materials costs drive design choices—instead of total environmental and social costs over the entire value chain. With a full understanding of the implications of their decisions, they can adjust their designs to lighten the load for the entire production process.

The overall score in this stage of the value chain is just 22, well below the overall average of 32. Apart from a few niche sustainability champions, the companies that best connect design to sustainability are big international sportswear and large entry-price players. Their scores are around 40.

The Pulse Survey further confirms that fashion design has significant catch-up potential. It is the stage with the second largest difference between fashion brands’ current low level of commitment and their intent to focus on this area in the future.

Indeed, some leading brands have made headlines with more sustainable designs. Nike has “designed out” waste from the start with its FlyKnit collection of footwear, whose one-piece upper avoids multiple stitched or glued panels, cutting waste volume during production by 60%.73 (See Encouraging Moves). But the industry would still benefit from universal design standards discouraging fiber combinations that pollute, harm, or consume excessive resources, and raising awareness in designers of their role and their collective impact.

**Encouraging Moves**

**Adidas:** The brand released athletic shoes under their ‘No Dye’ design principles, using materials in their natural ‘greige’ colour to avoid water or chemical use due to dyeing. www.adidas-group.com/en/sustainability/products/sustainability-innovation/#/adidas-nodye/

**TED (Textile Environment Design):** Practice-based sustainable design strategies that assist designers in creating textiles that have a reduced impact on the environment. Their approach is summarized in their report The TEN, including such topics as Design to minimize waste, Design for cyclability, and Design to reduce the need to consume. The TED team has led customized training activities at companies including VF Corporation to teach about sustainable design. www.tedresearch.net/teds-ten-aims/

**Levi’s:** In 2013, the brand released its Wellthread product development process and clothing line focused on sustainability. Instead of following a cost of goods target, the aim was to “do the right thing at every decision point”. This resulted in complexity reductions and decisions against producing certain products if this aim could not be achieved. The company states it was able to lower its price points by 30% year over year through this approach, achieving profitability, as indicated by a company representative in an interview in Ecouterre. www.levistrauss.com/sustainability/products/levis-wellthread-collection/
RAW MATERIALS

The raw materials stage has a disproportionately large impact on sustainability, partly because of the effect it has on recyclability. It involves the cultivation and sourcing of base materials, such as natural and synthetic fibers. (See exhibit 15.) Suppliers at this stage are referred to as Tier 3, whereas Tier 2 refers to processing and Tier 1 to manufacturers.

Data from the Higg Materials Sustainability Index (MSI), a cradle-to-gate material scoring tool by the Sustainable Apparel Coalition (SAC), shows that the materials with the overall highest environmental impact are leather and natural fibers (silk, cotton, wool). (See Exhibit 16.) These materials show the highest negative impacts across all dimensions. And even within one type of material there are considerable differences. Water use for cotton depends a great deal on the method of cultivation, while incorporating recycled polyester reduces a garment’s energy footprint.

The Pulse Survey confirms the Pulse Score findings. Large players are certainly more cognizant of the impact of their raw materials. Interestingly, the survey asked respondents to estimate what proportion of raw materials were sustainable (e.g., organic, recycled, regenerated, fair trade, BCI, Tencel®), and the average was a fifth. Yet only a tenth was labeled as sustainable and explicitly marketed as such.

There is a small but perceptible shift toward broader use of sustainably sourced materials. (See Encouraging Moves). One marker is the rising share of organic cotton.

Source: Higg Materials Sustainability Index, msi.higg.org, data retrieved on 27 September 2017; Levi’s (2015); H&M (2017); BCG Analysis

Note: These results were calculated using the Higg MSI tools provided by the Sustainable Apparel Coalition. The Higg MSI scores provided herein are for a single production stage within the Higg MSI scope. These scores do not reflect the impacts involved with material production. Please also include the date on which the information was retrieved and a link to the Higg MSI website (msi.higg.org).
BCI Cotton: The Better Cotton Initiative (BCI) aims to reduce the environmental impact of cotton production and improve the conditions under which it is produced. It claims a current share of 8% in global cotton production, targeting 30% by 2020—a first step in the right direction.

www.bettercotton.org/about-bci/

Lindex: The mid-sized Swedish brand focuses on materials with reduced impact. In 2016, 63% of its cotton use was organic. Overall, it could triple its use of ‘more sustainable materials’ from 17% in 2013 to over 50% today, including materials such as recycled polyester or Tencel®.

www.about.lindex.com/en/blend/

Worn Again: This start-up builds on a collaboration with large fashion brands. The venture’s chemical-recycling technology addresses major barriers in textile-to-textile recycling, namely how to separate blended fibers and how to separate dyes and other contaminants from polyester and cellulose. Worn Again aims to provide an alternative to the use of virgin polyester.

www.wornagain.info/

Nike: Its materials sustainability index allows design teams to compare the environmental impacts of 57,000 different materials.

www.about.nike.com/pages/sustainable-innovation/

www.about.nike.com/pages/sustainable-innovation/

Organic cotton, which can have only a quarter of the environmental impact of conventional cotton. Another is the active research into “classic” natural fibers such as hemp, flax, linen, and even nettle, all biodegradable. Although finishing processes for such fibers still limit their widespread use, these fibers generally require less water and fertilizer, and have greater natural resistance to weeds, which means that fewer herbicides are needed.

There are also novel bio-based raw materials. Lyocell, established now for years, consists of cellulose fibers made from dissolved pulp, for instance from wood (Tencel®) or bamboo (Monocel®). Bio-based Nylon 6.6 (one name is RENNLO®) comes from glucose and other renewable feedstock, and is in the early stages of commercialization. Other promising areas include research and prototyping on entirely new kinds of fibers, such as a merino wool-like yarn made of gelatin (undergoing trials at ETH Zürich), and leathery materials made from materials such as pineapple leaves (from start-up Ananas Anam).

Also encouraging are indices and apps from some brands that show designers the environmental impact of different materials and combinations.

Recycling the fibers would mitigate much of the environmental impact of raw materials, but current technology can cause a 75% loss of value in just the first cycle.

Chemical recycling can produce fibers of a quality comparable to that of virgin materials, but only for polyesters and nylon at present, and with added chemical by-products. Mechanical recycling works for natural materials, but the shredding usually leaves the individual fibers much shorter. As such it is a downcycling technology, reducing the quality of the material over time and hence creating a lower-value product, eventually ending up in a landfill. The mixing of fibers is another challenge: the addition of elastane, for example, precludes recycling with current technologies.

The economics of recycled materials are unappealing at present, as for example recycled polyester is 10% more expensive compared to virgin materials.

Even though, as outdoor brand Patagonia estimates, recycling saves 75% of the energy needed and 40% of the CO₂ compared to using virgin polyester, companies will make little headway until those numbers change.

To truly close the loop of the fashion value chain, both the technology and economics of recycling need to improve dramatically, ideally with a single standard to help with scaling up to commercialization. Getting there will require technological disruption, industry-wide collaboration and, hence, willingness to invest to truly move the needle.

©I:CO/SOEX Group
the proliferation of suppliers and the distance from brand operations. The issue is further complicated when processing suppliers, facing high demand, outsource and sub-contract to third-party suppliers unknown to the brand or retailer.

With environmental factors, transparency is especially an issue with chemical usage. Suppliers are looking to increase energy efficiency, a much-needed step as processing is very energy-intensive.

Production technologies are improving, galvanized by demand from brands and retailers keen to improve the eco-friendliness of their products. (See Encouraging Moves) But technology is no substitute for the protocols that help change practices everywhere along the value chain. Using technology to increase transparency and analysis is one thing; doing something with the resulting insights is another.

ENCOURAGING MOVES

Nike: For its 2016 Super Bowl collection of apparel, Nike used a novel dyeing process by Dutch company DyeCoo, in which pressurized CO2 is used to dye fabric. The company – as compared with greenhouse gas emissions at 37%, and land uses at 24%. The vast majority of water pollution occurs during raw material production and manufacturing. The effects of manufacturing, assembly, and stores, warehouses, and offices are negligible.

Out of all the raw materials used in the fashion industry, metals - in particular precious metals - have the highest water pollution impact.

Why should we care?

There are multiple adverse effects of water pollution on the environment. For human health toxins can build up in the body, potentially leading to cancer and other acute conditions. Excessive nutrients can reduce the oxygen in water and kill off the fish stock. Polluted drinking water for livestock may reduce the production, quality and safety of the meat.

HOW LARGE IS THE RELATIVE IMPACT?

In their 2015 EP&L, Kering estimates that water pollution contributes 12% of the total environmental footprint of the company - as compared with greenhouse gas emissions at 37%, and land uses at 24%. The vast majority of water pollution occurs during raw material production and processing. The effects of manufacturing, assembly, and stores, warehouses, and offices are negligible.

Out of all the raw materials used in the fashion industry, metals - in particular precious metals - have the highest water pollution impact.

Out of all the raw materials used in the fashion industry, metals - in particular precious metals - have the highest water pollution impact.

Why should we care?
The manufacturing stage involves cutting, sewing, buttonholing, gluing, welding, and seam taping the fabric, along with some dyeing and finishing such as stonewashing. Social factors are the main issue here with labor and health and safety standards having been in public spotlight recently. (See Exhibit 18.)

Manufacturing lags behind processing with a Pulse Score of 28. As elsewhere, the big sportswear players outperform the others with a score of 76, while the midsize and small segments reveal their catch-up potential with scores ranging from 18 to 43.

The Pulse Survey results are largely in agreement. They reveal brands’ declared intent to invest in more environmentally and worker friendly manufacturing processes. More than three-quarters of the companies polled state that they plan to elevate the topic by assigning head count and funding to it—the highest number for any of the value-chain steps. They realize there is much to do to “clean up” these operations.

Social impact is the main challenge. Brands and retailers are intensifying the spotlight on working conditions in their suppliers’ factories by closer monitoring, often with their own evaluations and clear minimum requirements. (See Encouraging Moves.) Consumers are increasingly seeking transparency in the value chain.

Yet in Myanmar textile factories, wages can still be as low as €55 per month, and little higher in Bangladesh. That’s half of what’s needed to sustainably support the workers and their families. A central challenge is the continual drive-down of pricing combined with the fierce competition among low-wage factories. Concerned about their international competitiveness, governments in many producing countries have hesitated to set minimum wages that meet workers’ basic needs.

Factories, of course, work under local laws governing labor conditions (for example, controlling working hours), environmental aspects (for example, governing chemical use) and other well-intended rules. Voluntary agreements abound, such as the bluesign label to certify production processes, the UN Global Compact, and Bangladesh’s Accord on Fire and Building Safety. The International Labour Organization publishes standards, albeit without the ability to directly implement or enforce them. Yet there is no cross-country legal framework that addresses all—or even a large part of—what is needed to secure fair wages and safe working conditions.

**ENCOURAGING MOVES**

**Levi’s:** The brand launched its Worker Well-Being Initiative in 2011, implementing programs to increase social sustainability at supplier factories. The brand had expanded its initiative to 12 countries by 2016 and aims to do so with 80% of its product volume by 2020. www.levistrauss.com/sustainability/people/

**Povigy:** The technology startup will soon launch a mobile app that lets shoppers evaluate the sustainability of participating brands directly in store. Povigy plans to base the evaluations on its own verification of the brands and on documentation describing upstream manufacturing processes. www.povigy.com

Transportation, which includes packaging as well as distribution, has clear impacts related to sustainability. (See Exhibit 19.) Yet the environmental and social footprints in this stage are much smaller than in other stages. That's partly because the activities in this stage are similar to what happens in other industries, so that fashion brands can benefit from the scale and innovation already in place elsewhere. For all the energy expended in moving apparel globally, this stage contributes only 2% of the climate-change impact of the entire value chain. The effects on water and chemicals are negligible.

Indeed, transportation’s overall Pulse Score is 41, highest of all the stages. Even the lowest-scoring performers in this stage do not fall below 28, while the top players exceed 90.

The Pulse Survey showed that brands spend little money, time and resources on transportation, as suggested in expert interviews because they already have programs, in collaboration with logistics partners, to optimize the flow of goods. Transportation is also one of the few instances where cost and environmental impact are closely tied together (See Encouraging Moves). Companies have built-in disincentives to discourage routine air-shipments.

**ENCOURAGING MOVES**

**Nike:** The brand offers an example for brands that have invested significantly in their warehouse operations to reduce their environmental impact. In 2016 the brand opened a new distribution center in Belgium, using 100% renewable energy from its own wind turbines and solar panels. It claims to recycle more than 95% of the waste generated onsite.

**Inditex:** The retailer introduced its Green to Pack program in 2015 to reuse and optimize packing materials and methods, saving 660 sea-container shipments and more than 185,000 m² of cardboard that year, equivalent in area to a 25 football fields.

Retail is where the magic happens for shoppers—where ambience and aspiration turn into purchase. It gets little attention for sustainability, which is unfortunate because it has great potential for improving energy use, reducing waste, and engaging with consumers. (See Exhibit 20.)

The retail stage’s Pulse Score is only 28, with low variation across the industry. The exceptions are the premium and luxury players, which fall short with scores around 13, and the sustainability champions, which have built their customer experience around the subject, at 75. Many of the latter have point-of-sale measures to drive a reduced footprint.

The Pulse Survey backs up those conclusions but adds that the big players deviate from this pattern with a higher level of commitment. With the retail stage as the main point of customer contact, brands can influence consumer behavior regarding wear and care of the products. And with many large stores, these companies are realizing that energy efficiency (on lighting and air conditioning for instance) may bring significant cost savings.

At first glance, it’s hard to grasp the overall impact of the retail stage. Inventory usually turns quickly, and staff are treated well, especially in premium stores. But all the bright lighting, heating, and ventilation can account for around 5% of the CO₂ generated over the value chain. Regulation is unlikely to play a part; as with transportation, most retailers will act in their economic interests to reduce energy consumption. (See Encouraging Moves.)

ENCOURAGING MOVES

Kering: The brand promotes renewable energy use in its headquarters and the stores of its brands. For single brands’ operations, it states ‘green energy’ shares of over 80%; it also invests in onsite production of clean energy through solar panels, announcing to have saved nearly 400 tons of CO₂ in 2014. It also encourages LED lighting in the stores of its brands to gain energy savings of up to 90% over older technologies. In 2015, Gucci invested €2.4 million to replace in-store lighting. www.kering.com/en/sustainability/

Inditex: By the end of 2016, Inditex had 4,519 eco-efficient stores accounting for over 60% of its stores, with the aim of reaching 100% by 2020. These stores save 20% in electricity and up to 50% of water consumption in comparison with conventional stores. The brand follows the guidelines and recommendations of the LEED certificate and the European BREEAM seal in order to ensure that the initiative keeps moving in the right direction. www.inditex.com/sustainability/environment/ecoefficient_stores
The consumer use phase is where the product is handled, washed, repaired, and possibly passed on. The magnitude of this phase's impact is not yet conclusively assessed in research and comprehensive data is lacking. A future edition of this report will elaborate on the topic in more detail. Yet, it is reasonably safe to assume that the main drivers are the energy and water consumption from washing, as well as the impact of detergents influence the impact as well.

Also important are attitudes about prolonged use. Not long ago, most apparel was carefully looked after, repaired, and handed down. With the coming of fast-fashion, in the past decade the number of garments purchased by the average consumer has more than doubled. Some consumers treat garments as nearly disposable, throwing them out after only a couple of wears.91

With a Pulse Score of 23, the industry seems to be neglecting this stage. Even the big fast-fashion and sportswear firms that do well elsewhere on the value chain are unable to top 20 at the consumer use stage. Only the sustainability champions surpass 50. The Pulse Survey underscores the Pulse Score findings, especially with regard to the lack of commitments to funding and resources to act on their concern. (See Encouraging Moves.) Regulators can help with inducements for prolonging a product’s life, as Sweden did by halving the tax rate on product repairs.

Meanwhile an intriguing sub-industry has emerged around clothing rental, using the web to minimize one-time use of garments. Start-ups include MUD jeans and VIGGA organic children’s wear. A caveat to these online rental business models, however, is the additional need for transport and for garments to be washed between rentals. Further, hardly anyone has yet managed to succeed in this concept profitably at scale.

As for reuse, more than half of respondents to a UK survey had bought used clothes in the previous year, and a fourth indicated that they would buy more if the choices improved. Two-thirds said they would consider participating in retailer buy-backs.92 Research in other EU countries, though, shows the long journey ahead: only 10% of respondents considered buying second-hand in their three most recent purchases.93

## ENcouraging MOVES

**Patagonia:** Through the brand’s Worn Wear program consumers can send in worn or lightly damaged Patagonia apparel to be repaired. The program involves 45 full-time repair technicians at a service center, completing about 40,000 repairs a year. The program also extends to a collaboration with iFixit, an online repair resource, to create care and DIY repair guides for consumers.

**Stella McCartney:** Together with Clevercare the brand releases an ongoing series on steps consumers can take to prolong the useful life of its products and reduce their own environmental impact during use. It also equips its products with the Clevercare label, providing for instance washing advice to minimize the footprint of product care.

**Rent the Runway:** The clothing rental firm started off in 2009, and in 2015 it introduced its Unlimited subscription, allowing customers to hold on to as many as three pieces of apparel at a time for as long as they want for €130 per month. Rent the Runway even partnered with high-end retailer Neiman Marcus in late 2016 to offer its rental services in store outlets. The concept is clearly a winner: in 2016, the company generated annual revenue of more than €90 million, up from €40 million in 2014 (according to Recode).
When it comes to the end of the life cycle of fashion products, different fates are possible. They can be put to a different use (e.g., second use with a new owner), up- or down-cycled, fully recycled (feeding back to the fashion value chain to ‘close the loop’) or just disposed of, winding up in landfills. Here lies the largest driver of this stage: preventing products from ending up as pure waste. (See Exhibit 22.)

The Pulse Score here is 9, the lowest of all the stages. Even segments that score well in other stages do poorly, some as low as 15. Only the sustainability champions do well at 46. As with consumer use, this low achievement level likely reflects little industry attention or a lack of technologically and economically viable solutions.

The Pulse Survey underscores these results and reveals that across the value chain, recycling options are perceived to be the least relevant improvement levers. (See Exhibit 23.) Further, in interviews, companies have expressed a wish to “fix the basics” of sustainability elsewhere in the value chain before working on end-of-use.

But does the fashion industry even need to get involved? Don’t consumers already use the clothing drop boxes available and respond to the leaflets from non-profits offering free pickups of castoffs? Some do—yet across the EU27 nations, only 18% of clothing is reused or recycled (See Exhibit 24) and the U.S. number is even worse. In contrast to glass, plastic, and paper waste, apparel

gets little respect at disposal. Indeed, when it comes to packaging, recovery and recycling rates are at 98% in Germany and 79% in Belgium.97

The used-textile market was worth close to €4 billion worldwide in 2015.98 But consumer hesitance toward second-hand clothing in developed countries make it unlikely that the reuse market can develop as a robust, growing part of the fashion industry’s value chain without major changes in fashion brands’ and consumers’ views.

Transitioning to a ‘closed loop’ fashion value chain is needed, where discarded products are used as raw materials for production—a ‘circular’ industry model. End-of-use already receives some notable attention from individual brands, such as Patagonia’s Common Threads program for Teijin polyester, which is chemically recycled for use in new garments. While admirable, this and other advances (see Encouraging Moves) lack scale, and must be amplified in coordinated efforts among brands, regulators, and consumers. (See Chapter 3.)

ENCOURAGING MOVES

H&M: The brand has partnered with I:CO, a solutions provider for clothing and footwear reuse and recycling. Its facility in Germany receives 25 to 30 truckloads a day from collection bins at H&M stores. The brand has similar facilities in the US and India. In 2016 it collected nearly 16,000 tons, a 29% increase from the year before. The brands CEO Karl-Johan Persson is satisfied with the program’s results, as he states: “According to our customers surveys, our garment collecting program quickly became the sustainability initiative with the highest awareness amongst our customers. It is tangible for consumers and makes them a part of it.” He also confirms that many stores reported positive feedback, both in terms of handling processes and customer reactions.

Esprit: Since 2016, together with the charity Packmee, the brand lets customers donate clothing via free shipping to the company, which gives part of the revenue generated to the Red Cross, along with a 10% discount voucher back to the customer.

www.esprit.com/sustainability
GAINING MOMENTUM

Fashion brands have many opportunities to move to better business practices, following after standout brands and newcomers built around sustainability. But they face too few external pressures for change, aside from a few NGO campaigns such as Greenpeace’s ‘Detox’. Consumers show too little concern, nor is there much of a regulatory push. Indeed, nearly half of Pulse Survey respondents strongly criticized regulators for doing little to hold the industry to account. Respondents are looking to industry associations to drive industry collaboration, particularly with smaller brands. While collaboration has begun on local initiatives such as the Bangladesh Accord on Fire and Safety and country specific Better Work programs, strong global efforts have yet to take shape.

The good news is that fashion brands recognize the upside. While 30% of Pulse Survey respondents identified sustainability as “a social responsibility that fashion brands should fulfill,” 31% tagged it as “an immense business/value creation opportunity for fashion companies.” Big brands, with more than €4.4 billion in annual revenues, were even more enthusiastic: 50% checked the box for “immense opportunity.” (See Exhibit 25.) Only 5% listed it as a “hygiene factor that every fashion firm needs to address so as to not lose out to the competition.”

To capture the opportunity, however, the industry needs greater awareness of the principles and levers for improving the situation. This is particularly true for most of the small to medium sized players that show significant room for improvement according to the Pulse Score. This report aims to close that transparency gap with Good Citizen Principles. (See following page.) It presents the minimum requirements and current best practices for companies to follow, adjusted for the degree of maturity around sustainability.

But even if all companies from small to large were to adhere overnight to the Good Citizen Principles or match the efforts of the upper quartile achievers on the Pulse Score, it would not be enough to realize the full €160 billion value potential to the world economy. As of yet, too few concerted, cohesive, persistent initiatives bring together players from across the fashion industry ecosystem, allowing them to implement novel solutions that go beyond today’s best practice. Brands, suppliers, and stakeholder organizations must not just step up, but also pull together collectively.

<tr>
<td><strong>Planning of durability (material and design)</strong></td>
<td>• Durability criteria for large majority of materials, supported by lab testing</td>
<td>• Full coverage of lab testing for materials, at least half of styles subject to field testing</td>
</tr>
<tr>
<td></td>
<td>• Optimizations of basic items for waste reduction, e.g., when cutting fabrics and sewing with minimized excess fabric</td>
<td>• Consider simplicity/timelessness of design also across seasons to ensure efficient manufacturing and robust products</td>
</tr>
<tr>
<td><strong>Optimization of design recycling</strong></td>
<td>• Optimization of majority of items for waste reduction, e.g., when cutting fabrics (pattern efficiency);</td>
<td>• Design for enabling closed loop recycling in choice of fabrics, trim, design elements and processing</td>
</tr>
<tr>
<td><strong>Supplier transparency &amp; traceability</strong></td>
<td>• First initiatives started to improve low transparency, e.g., through participation in multi-stakeholder collaborations</td>
<td>• Specific measures in place to improve high (but still not full) transparency in the future, e.g., personal visits, participation in 3rd party verified collaborations, only work with agents showing better levels of transparency</td>
</tr>
<tr>
<td><strong>Environmental footprint tracking</strong></td>
<td>• First measures in place to track environmental impacts for known suppliers; initiate setup of certified supplier base</td>
<td>• Full environmental risk tracking initiated where visibility is already available; action plan on how to extend to additional suppliers</td>
</tr>
<tr>
<td></td>
<td>• Active in collaborations to tackle environmental issues more efficiently</td>
<td>• Clear targets for proportion of certified suppliers and materials (e.g., 100% organic cotton)</td>
</tr>
<tr>
<td></td>
<td>• Specific measures in place to improve low transparency, e.g., through participation in multi-stakeholder collaborations</td>
<td>• Increase supplier engagement based on personal visits or collaborations; industry leaders help shape agenda of collaborations to distribute knowledge across the industry</td>
</tr>
<tr>
<td><strong>Sustainable material mix</strong></td>
<td>• Provision of guidelines for sustainable sourcing of main materials, e.g., mandatory certifications, minimum compliance requirements</td>
<td>• Use more sustainable sourcing for all key materials, such as organic cotton, recycled polyester</td>
</tr>
<tr>
<td></td>
<td>• Clear action plan developed to track social labor standards for known suppliers and to set up certified supplier base; work towards preventing child labor</td>
<td>• Set targets for key materials, e.g., 50% of cotton sourced from cotton initiatives such as organic cotton, Cotton made in Africa, Better Cotton Initiative</td>
</tr>
<tr>
<td><strong>Social labor conditions</strong></td>
<td>• Clear action plan developed to track social labor standards for known suppliers and to set up certified supplier base; work towards preventing child labor</td>
<td>• Use fair trade suppliers where possible (e.g., to allow for funds into extra wages or into community projects); certify that no child labor is in place and monitor efforts</td>
</tr>
<tr>
<td></td>
<td>• Active in collaborations to tackle social labor issues more efficiently</td>
<td>• Provide training to workforce to reduce health &amp; safety risks</td>

<tr>
<td>Environmental footprint</td>
<td>• Environmental impact tracking established for &gt; 1/3 of 2nd tier suppliers with plans laid out on how to extend tracking</td>
<td>• Environmental impact tracking established for all 2nd tier suppliers; increased supplier engagement based on personal visits or collaborations. • Help distribute knowledge across industry through collaborations. • Providing targets and guidelines (e.g., chemical use and substitutes) for min. 1/3 of facilities, e.g., by joining collaborations/using agencies. • Full enforcement of Restricted Substance Lists in industry collaborations to find substitutes. • Measures initiated to single out most reliable suppliers, consolidate supplier base, build long term cooperation to help suppliers improve their environmental performance.</td>
</tr>
<tr>
<td>Social labor conditions</td>
<td>• Clear action plan developed to track social labor standards only used certified supplier base; part of collaborations to tackle social labor issues more efficiently. • Only work with certified suppliers, provide extended guidelines to suppliers, e.g., help negotiating prices for substitute chemicals, set targets for social performance, e.g., on collective bargaining, trainings to improve health &amp; safety and productivity.</td>
<td>• Only work with certified suppliers, provide extended guidelines to suppliers, e.g., help negotiating prices for substitute chemicals, set targets for social performance, e.g., on collective bargaining, trainings to improve health &amp; safety and productivity.</td>
</tr>
<tr>
<td>Environmental footprint</td>
<td>• &gt;1/2 of 1st tier suppliers with tracked environmental impact; clear targets set, e.g., by jointly assessing manufacturing efficiency with facilities. • Reduction of packaging waste (less packaging, re-use), supported by clear target setting.</td>
<td>• Impact tracking for all suppliers; track record of improved environmental performance; increased supplier engagement based on personal visits or collaborations. • Distribute knowledge across the industry through collaborations. • Cooperation or sharing of guidelines on machine standards. • Investment support for facilities to upgrade technology; improvements in production methods, packaging and energy efficiency with clear impact reduction targets.</td>
</tr>
<tr>
<td>Social labor conditions</td>
<td>• Measures in place to track social labor standards, only use certified supplier base; part of collaborations to tackle social labor issues more efficiently. • Only use certified suppliers, provide extended guidelines to suppliers, e.g., optimize production for health and safety. • Planning of production to ensure sustainable working hours; trainings with impact on health and safety as well as productivity.</td>
<td>• Only use certified suppliers, provide extended guidelines to suppliers, e.g., optimize production for health and safety. • Planning of production to ensure sustainable working hours; trainings with impact on health and safety as well as productivity.</td>
</tr>
<tr>
<td>Environmental footprint</td>
<td>• Full tracking of impact, at least for closer transportation steps (road to and from warehouse), dedicated tracking of air freight. • Target setting to reduce impact per garment.</td>
<td>• Full tracking of environmental impact per means of transportation, also in the beginning of the value chain. • Target setting and dedicated programs to optimize impact per garment, including location planning of facilities/production steps, transport intervals and space needed for packaging.</td>
</tr>
<tr>
<td>Transportation</td>
<td>• Supplier cooperation initiated on efficiency for closer transportation steps (final transportation to warehouse, warehouse to retail outlet). • Target setting in place.</td>
<td>• Full cooperation on space utilization including utilization of “bays journey” (e.g., assisting empty containers). • Target setting in place and track record of reduced impact.</td>
</tr>
<tr>
<td>Utilization of transport space</td>
<td>• Care &amp; Repair information on garment tags optimized for low environmental impact (e.g., recommend less and low temperature washing, highlight urgency of repair versus throwing an item away), successively implemented. • Providing replacement buttons and yarn with the item.</td>
<td>• Care &amp; Repair information on garment tags optimized for low environmental impact (e.g., recommend less and low temperature washing, highlight urgency of repair versus throwing an item away), successively implemented. • Providing replacement buttons and yarn with the item.</td>
</tr>
<tr>
<td>Communication of sustainability</td>
<td>• General communication in most PoS advocating sustainability; e.g., environmental impacts of materials; engagement in collaborations to promote these standards across the industry.</td>
<td>• More detailed communication included in most PoS; advocating sustainability messages, e.g., reminders to recycle, importance of repair to prolong useful life of garment, systematic training of store personnel to educate customers around care and repair of clothes. • Collaborate in establishing further data on labels, such as E-PAL/CAL data.</td>
</tr>
<tr>
<td>Environmental standards at the PoS</td>
<td>• Tracking of energy usage in retail outlets, plans developed to minimize energy and water consumption as well as waste; use of certification (e.g., LEED) for at least the newest retail outlets.</td>
<td>• Full guidelines for energy and water usage in retail outlets (buildings and processes), measures in place to maximize waste reduction and use of renewable energy; full adaptation of all existing outlets to meet guidelines.</td>
</tr>
<tr>
<td>Care &amp; Repair</td>
<td>• Care &amp; Repair information on garment tags optimized for low environmental impact (e.g., recommend less and low temperature washing, highlight urgency of repair versus throwing an item away, providing specific repair manuals), in place for all products. • Providing replacement buttons and sewing kit with the item. • Offer repair services, e.g., specific repair offering.</td>
<td>• Care &amp; Repair information on garment tags optimized for low environmental impact (e.g., recommend less and low temperature washing, highlight urgency of repair versus throwing an item away, providing specific repair manuals), in place for all products. • Offering additional repair channels to customers—take-back models in stores, pick up services, feed back into second-hand material processing for new items. • Offering recycling infrastructure in public spaces to clothes of other brands, engaging in cooperation with competitors to push cross-industry initiatives. • Piloting new business models (e.g., rental fashion) to reduce waste/culture and invest in new recycling technology.</td>
</tr>
<tr>
<td>Preparation of items for recycling</td>
<td>• At least on core items, materials which can be recycled are labeled explicitly on the item to allow easier recycling process.</td>
<td>• Extended optimization of materials (~32% of volume), e.g., non materials mixes obstructing recycling and explicit labeling to enable easier separation of materials.</td>
</tr>
<tr>
<td>Communication of recycling opportunities</td>
<td>• High level education of customers on recycling opportunities (e.g., donation boxes).</td>
<td>• Specific education of customers on recycling options, e.g., existing infrastructure (internal and external to brand), where to send items for recycling and which items can be recycled.</td>
</tr>
<tr>
<td>Support and setup of dedicated recycling infrastructure for clothing</td>
<td>• Specific communication of recycling offerings by other providers external to brand. • Taking part in collaborations to push setup of recycling infrastructure in public spaces.</td>
<td>• Offering recycling channels to customers—take-back models in stores, pick up services, feed back into second-hand material processing for new items. • Offering recycling infrastructure in public spaces to clothes of other brands, engaging in cooperation with competitors to push cross-industry initiatives. • Piloting new business models (e.g., rental fashion) to reduce waste/culture and invest in new recycling technology.</td>
</tr>
</tbody>
</table>

**CHAPTER 2**

**PULSE OF THE FASHION INDUSTRY**
Thus far, GFA and BCG have pointed to a host of initiatives that are to be applauded and encouraged. There is plentiful evidence that many fashion brands are aware of their impact and ready to engage further at many stages of the value chain. But it has been demonstrated as well, that over 50 percent of the industry, especially small and medium-sized players have not started to take actions yet.

It is also clear that more needs to be done to counteract the impacts that come with the projected increase in consumption. Even if all companies lived up to the good citizen principles, planetary boundaries would still be stretched and only less than half of the €160 billion outlined value potential to the world economy could be realized, even under optimistic and ambitious assumptions, as will be outlined.

So what is the best way forward? What could we do that we do not do today or are not thinking about today? Are there new and different ways to design, produce, sell, and use clothing?

**Many fashion brands are aware of their impact and ready to engage further. However over 50 percent of the industry has not started to take action yet**

In the following, we will guide you through the full Landscape of Change as we see it, based on what we already know today. Each dimension of change will take the two outlined perspectives:

1. **Pragmatic, immediate actions that can produce palpable change in economically viable ways:** These can be implemented with today’s technologies and capabilities with ambitious targets and initiatives, going beyond pure good citizen principles.

2. **Novel solutions and disruptive actions based on collaborating and innovating:** These rely on bolder technologies and collective approaches, potentially going beyond what we know today, to achieve outszie impact.

The proposed landscape is a first attempt to sketch out the spectrum of options available. It is meant to invite further input and rich discussions during the coming year. And of course, new technologies and solutions will emerge that we cannot imagine today. These will find their way onto future versions of the Landscape for Change.
The Landscape for Change will have the following change levers and goals. (See Exhibit 27.)

Environmental:
- Closed loop recycling – No value leakage, e.g., one garment recycled for every new garment produced
- Sustainable material mix – 100% sustainable fibers with low footprint, e.g., replacing conventional cotton
- Reduced energy footprint – Minimized energy consumption and 100% carbon neutrality
- Chemical and water optimization – No hazardous chemicals and no water pollution
- Production-to-demand – No overproduction

Social:
- Rebalanced industry economics – Fair and equal pay to worker and skill development for all workers
- Health and safety excellence – 100% safe working places fostering well-being and morale
- Advocacy of human rights – No human rights abuses and full rights advocacy

Overarching:
- Transparency and traceability – Full visibility on all tiers’ supplier performance and conditions
- Consumer engagement – Complete customer information on a garment’s life-cycle impact, environmentally and socially
- Novel business models – Full utilization of purchased fashion products

Moving toward these goals will go a long way toward achieving the €160 billion a year opportunity for the world economy described in chapter 1. Staying on the current path, by contrast, will put the industry at risk of significantly higher costs.

A COLLECTIVE EFFORT IS REQUIRED TO GO BEYOND WHAT IS POSSIBLE TODAY

GFA and BCG have quantified a number of initiatives available to individual companies to demonstrate that there is value to be captured today if the industry starts acting now. The quantifications of these levers will be further outlined in the course of this chapter.

Disclosing the result up front: By summarizing all quantifiable levers, it can be seen that there is a combined value opportunity of ~€60bn available to the world economy through the use of ambitious yet realistic levers that can be implemented by individual businesses already today. (See Exhibit 26.)

But with a value of at least €160bn at stake, ~€60bn clearly falls short of the target. In order to access the remaining value opportunity, a collective push is needed across the industry. This collective movement will bring the industry toward well-balanced, outward-looking practices ensuring that fashion brands can prosper while making smart choices that benefit their growth as well as the economy at large. Possible disruptive solutions for industry-wide collaborative initiatives will be explored in detail across environmental, social, and overarching levers.

TO CAPTURE THE FULL €160 BILLION OPPORTUNITY, THE INDUSTRY NEEDS A COLLECTIVE PUSH

- **Ambition**: 100% closed loop
- **Non-exhaustive landscape**—to be collectively expanded

---

1. E.g., conventional cotton or leather 2. Cotton grown traditionally, excludes Better Cotton Initiative, Cotton Made in Africa, organic cotton, recycled cotton

Source: BCG analysis
If the industry manages to fully close the loop between the end-of-use phase and the raw materials phase, recycling apparel and footwear waste into new input materials, the environmental footprint of the entire industry will be drastically reduced. This type of circular model is the ultimate aim of all actions targeting recycling.

**Immediate Actions**

Offer end-of-use in-store garment collection scheme. Driving down current and future waste levels is essential. Hence, progress starts with increasing collection rates at the end of a garment’s life. Through their interface with consumers, brands and retailers can lead in boosting collection rates.

We anticipated that today’s 20% collection rate could be tripled by 2030—worldwide. With a 60% collection rate, the same allocation to end-of-use processing as today, the industry could save more than €4 billion in value to the world economy. This value only represents products not ending up in landfills—not to mention the additional value to be realized by ‘closing the loop’ and feeding products back to the value chain as raw material. The industry would still be creating vast volumes of waste—more than 90 million tons a year—but the absolute amount would no longer grow with rising production. Clearly, this target calls for a dramatic change in consumers’ mindsets, not to mention much more attractive collection options.

Fashion brands can step up collection programs for end-of-use—especially in their own-brand stores. They can set up reverse supply chains—or work with third-party logistics and processing providers—to sort the apparel, process it, and send as much recycled raw material as possible back to their suppliers’ factories.

**Disruptive Actions:**

Establish industry-wide end-of-use garment collection. These go beyond brand-specific pickup, and could take the form of every brand deploying boxes in every store for every garment type. It can also mean moving to a more overarching setup of public collection points in areas with currently limited garment collection opportunities.

**Design for recyclability.** While maximizing collection is essential, we need to work toward true recycling—feeding previously used materials back into textile production, rather than downcycled into low-value uses. The industry can craft clear guidelines for designers to collaborate with others along the value chain.

**Breakthrough in recycling technology.** Technology offers the best way to eliminate barriers to large-scale recycling. Smart garments would allow sorting machines to detect fiber types and determine the practicality of and next steps for further processing. The industry has to advance to new process technologies that will make it possible to chemically recycle every possible fiber combination at scale and to mechanically recycle with no significant loss in fiber quality.

**Sustainable Material Mix:**

Target 2030: 100% sustainable fibers with low footprint, such as replacing conventional cotton

Since one of the largest determinants of the industry’s environmental footprint is the material mix, especially leather and natural fibers, fashion brands should carefully consider the fiber mix choices. Certificates for sustainable materials and production methods are on the rise, such as Cradle-to-Cradle (see Sustainable Products Possible at Competitive Prices—Evidence with New C2C-Certified™ T-shirt).

**Immediate Actions:**

Reduce conventional cotton use. We calculate that reducing conventional cotton by 30% can yield more than €18 billion in annual water savings. Polyester, more than any other alternative, has the cost efficiencies and production scale to be a practical substitute. (See more details on the footprint advantages of polyester over cotton in Exhibit 28.) Polyester already makes up most of the global textile fiber mix, and after decades of development, we can make it with characteristics resembling those of cotton.

The mathematics works as follows. Replacing 30% of cotton use by polyester in 2030 would save roughly 23 billion m³ of water annually—water valued at €0.81 per m³. The goal is realistic, especially since it would call for an increase of only 17% in today’s polyester production, considering a one-to-one cotton-to-polyester substitution.

Polyester is no perfect answer, of course. It comes with its own challenges. In a 2017 study, it is estimated that 15% to 30% of plastics polluting the oceans can be attributed to primary micro-plastics, with 35% of those attributed to laundering of synthetic textiles. (See Micro-plastic Contaminating Oceans.) Moreover, polyester’s production relies heavily on fossil fuels. It is a non-renewable resource and is not biodegradable.

Yet polyester lends itself to fiber-to-fiber recycling better than cotton does. It can also be made from waste products such as plastic bottles. Further positive developments include innovations that minimize the impact...
of plastic microfibers, for example through protective bags for clothing during washing (such as Patagonia partner Guppy Friend) and filters for washing machines (such as filters from Wexco).

Other alternatives to traditional cotton include organic, recycled, re-generated, fair trade, or BCI cotton. These are viable options, especially in the short term, where fashion brands and consumers may not be ready for a complete elimination of cotton. (See Reduce Toxic Fertilizer and Chemicals in Raw-Materials Stage under Chemical and Water Optimization.)

Increase use of sustainable materials. Several environmentally preferable alternatives exist or are under development besides polyester. Substituting cotton with bast reduces the environmental impact by more than half, with the largest gains in water conservation. (See Exhibit 28.) Viscose and lyocell also have lower water and energy footprints. The challenge here is to convince consumers that alternative fibers are as comfortable and good looking as cotton. There already is research in that direction, as with the CRAiLAR FTI process for bast, giving it a softer cotton like hand and appearance.101

Environmental damages of water use for human health, ecosystem quality and resources. Prevalent in the raw materials and processing phases

Global Warming

Emissions of greenhouse gases. Prevalent in processing and manufacturing phases.

Eutrophication

Excessive richness of nutrients in a lake or other body of water frequently due to runoff from the land, causing dense growth of plant life and death of animal life from lack of oxygen. Prevalent in the raw materials phase.

Abiotic Resource Depletion, Fossil Fuels

Depletion of natural resources faster than they can be replenished. Prevalent in raw materials and manufacturing (sundries and packaging).

Source: Higg Materials Sustainability Index, msi.higg.org, data retrieved on 27 September 2017; Levi’s (2015); H&M (2017); BCG Analysis
Synthetic leather has only a third of the environmental impact of cow leather. (See Exhibit 28.) As Kering says in its 2015 EP&L statement, different leathers can have an over tenfold difference in environmental impact based on their type and origin, how the animal was raised, and how the tanning process took place. Switching to alternative materials can directly improve a product’s footprint. (See Exhibit 29.)

Disruptive Actions:
Establish common standard for animal treatment.
In its 2030 Agenda for Sustainable Development the United Nations sets as one of its goals to achieve a state “in which wildlife and other living species are protected”\(^\text{102}\). While animal welfare in general is a topic that most can approve of, agreeing on what it implies for industrial production processes is much more difficult.\(^\text{103}\) Fashion brands’ policies around the subject are less developed today than those concerning the environment.\(^\text{104}\) The focus areas are angora (rabbit), down, fur, leather, and wool. Collaboratively developed standards would go far to guarantee the ethical treatment of animals, enabling them to live healthy lives without suffering from pain, fear or distress.\(^\text{105}\) These would include rejecting methods such as force-feeding or live plucking of waterfowls, as well as promoting transparency in farming and processing practices. A common standard establishes a global benchmark and helps fashion brands communicate expectations along their supply chain, as well as the sharing of best practices.\(^\text{106}\) Promising initiatives include the recently launched Responsible Wool Standard (RWS), the Responsible Down Standard (RDS) or the Sustainable Fibre Alliance (SFA) on cashmere production. Widened partnerships of such initiatives and industry-wide adoption would be the next step.

Micro-plastics Contaminating Oceans

Micro-plastics are small pieces of plastic invisible to the human eye. Primary micro-plastics are directly released into the environment as small particles, whereas secondary micro-plastics largely stem from the degradation of larger plastic waste after entering the ocean.

The main sources of primary micro-plastics are tires, synthetic textiles, marine coatings, road markings, personal-care products, plastic pellets, and city dust. Thus, the sources range from household to commercial activities conducted on land and at sea.

The full consequences of increasing amounts of micro-plastics in the world oceans are not conclusively known. However, the suspected consequences include human health concerns due to accumulation of micro-plastics in the food chain as well as the absorption of toxicants in plastic traveling through the environment:\(^\text{1}\)

PROOF OF CONCEPT
Li & Fung: Investments in lowered impact breaking even after one year

A recent pilot conducted by Li & Fung at their LF Beauty factory in the UK, show promising results from the use of sensors to drive energy efficiency in production. More specifically, the wireless sensors capture energy and production data at a granular level to counteract the major operational cost of electricity. The facility had already captured ‘low hanging fruits’ by installing LED lighting and lights switch-off policies in order to increase the energy efficiency.

The project required investment in 30 sensors along a single production line and at key points in the facility. The investment broke even already within the first year due to the realized energy savings. The company is currently exploring how to implement this type of technology in its garment factories.

Source: Company information
Develop innovative man-made fibers. Some innovative man-made fibers are emerging with reduced water and energy intake and without the negative externalities of other fibers. Adidas, for instance, presented in 2016 a shoe featuring a fully biodegradable, protein-based yarn named Biosteel® that relies on nature-based finishing.62

Develop polyester enhancements. Another priority is to develop next-generation polyester. The industry must overcome the problem of polyester micro-particles and produce polyester fibers without heavy metals (e.g. antimony free). There is also work to do to persuade consumers that polyester can be as appealing as cotton. Branded materials such as Tencel® show how materials that originally did not directly speak to consumers—in this case Lyocell—can successfully be marketed toward them. Designers must also embrace and promote these fibers in their creations.

Energy is the largest individual impact area in terms of the value opportunity to the world economy. Further, many solutions for improved efficiency are already available.

Immediate Actions:
Increasing efficiency in the value chain’s most energy-intensive step of processing. The energy-intensive processing stage, with its high global-warming footprint, is an obvious target. The energy-efficiency potential is greatest in the least-developed countries, where most fashion products are made. But the more developed producing countries can also improve. Measures include combined heat and power sources, high-efficiency motors and boilers, variable-frequency drives, and improved sensors. With assumed increases in efficiency of 10% to 30%, an annual amount of 90 million tons of CO₂ equivalent can be saved globally, representing nearly €6 billion to the world economy. Suppliers can realize significant savings in upgrading their facilities. (See Investment in Lowered Impact Breaking Even After One Year).

Using renewable energy in the production stage. We estimate that this lever can release €12.5 billion in annual savings, assuming the industry can quickly reach a global target of 40% renewable energy. At that rate, approximately 200 million tons of CO₂ could be saved—equivalent to 7% of global annual emissions in 2030 for the fashion industry. Spinning, weaving, and pre-treatment, as well as dyeing and finishing processes, are energy intensive.63 While the International Renewable Energy Agency projects that by 2030 the use of renewable energy in the US will increase to 27%,64 in Africa to 22%,65 and in the EU to 27%,66 this will fall short of offsetting the additional anticipated emissions. Far-reaching actions by textile suppliers and continuous pressure from brands and consumers can push these numbers higher.

Disruptive Actions:
Establish 100% renewable-energy use. The benefits of installing solar panels or wind turbines at or near large production facilities transcend straightforward operating-cost benefits. Self-sustaining energy supplies from renewables can mitigate risks in countries such as Pakistan, where power cuts are common and diesel generators are expensive and costly to maintain. Large installations can further reduce operating costs if they supply numerous nearby facilities at the same time. Of course, that calls for unprecedented levels of collaboration among multiple suppliers.

Chemical and Water Optimization:
Target 2030: No hazardous chemicals and no water pollution

Chemical and water optimization has traditionally been difficult to address for fashion brands due to low transparency in the earliest stages of the supply chain. But with increased media and corporate attention, brands can engage with suppliers to set targets.

Immediate Actions:
Reduce toxic fertilizer and chemicals in raw-materials stage. Today’s excessive use of chemicals leads to heavy pollution of waterways. These concerns can be mitigated by more sustainable cultivation methods.67 The Better Cotton Initiative (BCI) projects a 16% pesticide reduction in China and a 20% decrease in India, through its improved cultivation principles.68 Cotton made in Africa (CmiA), for instance, says that cotton grown with their methods uses only rainwater and has a 40% lower CO₂ footprint.69 Organic cotton yields can be 25% less than conventional yields, and require more manual labor, but research indicates that the benefits outweigh the costs of producing better cotton.70 So moving from conventional cotton to organic/BCI or CmiA is a first interim step; in the long run, lower-impact materials than cotton should prevail.

Reduce water pollution. Shifting away from conventional cotton will reduce excess nutrients in waterways. Processing mills can better detect leaks and reuse water-in-process, but a full solution requires wastewater treatment plants on site, with sufficient testing.71 The Zero Discharge of Hazardous Chemicals Programme (ZDHC)—a collaboration of 22 signatory brands and 24 value-chain affiliates—is working on guidelines. Signatory brands include H&M, Kering, Primark, Adidas, and Inditex.

PROOF OF CONCEPT
Kering: Making metal-free tanning economical
It is 20 to 25 percent more expensive to tan skins without the use of metals. The higher expenses stem from salting of the skins at the beginning of the process, which ruins some of the skins and thereby creates waste. As a way to drive down costs, Kering resells those skins to other industries using skins of that quality. This has reduced the cost of the process to 10 to 13 percent more expensive than tanning using metals. The company is confident to further drive down costs with scale of production—ideally driven in a joint industry effort.
Source: Company information

Source: Interview with Kering CEO François-Henri Pinault in 2016, as published in Bloomberg Businessweek
Improve chemicals management in processing. The use of chemicals is one of the areas with the lowest transparency throughout the value chain, particularly in processing. The lack of transparency hinders compliance and leads to the exposure of workers to hazardous chemicals. We estimate the fashion industry can save the world economy nearly €3 billion if fewer workers become ill due to imprudent chemical use. Given the current low achievement scores on chemicals management across the industry on the Higg Index, change can start with actions by individual brands to enforce their Restricted Substances List. Further measures might entail upfront investment but could quickly become financially viable. (See Making metal-free tanning economical).

Disruptive Actions:
Refine chemical- and water-reduced processing. Major improvements in production steps are required to fully move beyond using hazardous chemicals and also to reduce wastewater pollution, especially in dyeing.

For a start, there have been several promising developments for reducing the water and energy required during dyeing, such as H2COLOR, a novel dye produced by Ecofoot. The company promises to reduce energy use by 80% and water intake by 70% because the negatively charged particles used in its dyes wash off easily. Use of Ecofoot’s dye takes 45% less processing time than conventional dyeing does. Another possibility is for the fibers themselves to be more receptive to dyes. DyeCoo is pioneering in the field of fully waterless processing, with CO₂ replacing water and process chemicals. So far it is suitable only for polyester and the machines are costly. But further measures available to suppliers can successfully reduce resource consumption while having positive influence on costs. (See Supplier Realizing Optimized Impact from the Outset)

Make hazardous chemical treatment redundant. The ultimate objective should be to eliminate chemicals and other hazardous input factors. OrganoClick is working on making outdoor wear waterproof without perfluorinated chemicals. Their product OC-aquasil Tex is still a chemical additive but achieves its water-repellent effect without using PFC and is biodegradable under certain conditions. It also needs less energy in its application, because it requires lower temperatures than conventional products. A glimpse of full revolution comes from NEFFA, whose Myco-Tex research project uses pure mushroom roots that grow by replicating over and over again in a molded form. It allows for flexible clothing without spinning, weaving, or chemical treatment, and is fully biodegradable. Startup Pili Bio relies on micro-organisms for its dyes and could soon go commercial.

Proof of Concept
Hirdaramani Group: Supplier Realizing Optimized Impact from the Outset

Suppliers play a key role in driving initiatives for improving environmental and social impact and, more broadly, conscious business practices in the early stages of the value chain. Hirdaramani, supplier to brands such as Marks & Spencer, Calvin Klein, and Tommy Hilfiger with 38 production facilities across Sri Lanka, Vietnam, Bangladesh, and Ethiopia, opened a factory focusing on sustainable manufacturing which compared with conventional apparel manufacturing facilities shows:

• 50% reduction in energy consumption, through an advanced evaporative cooling system, a prismatic skylight system, solar-powered street lamps, energy-saving fixtures, and solar-panel systems providing up to 8% of the factory’s power needs and exporting excess power to the national power grid.

83

CHAPTER 3
PULSES OF THE FASHION INDUSTRY

84

Production-to-Demand: Target 2030: No overproduction

Overstock is one of the most pressing problems of the industry, leading to high markdowns and lost value. Planning production to match demand is necessary and beneficial to businesses and the economy alike to avoid wasting natural resources.

Immediate Actions:
Intensify engagement with supplier base and provide order security for suppliers. By embracing and including suppliers in the calculation of the supply-demand equation, brands can improve demand planning and production scheduling. It allows for better workforce planning at the suppliers, limiting excessive overtime and outsourcing to third-party suppliers unknown to the brand. Constant dialogue and closer relationships with a preferred supplier base also boosts flexibility and transparency.

Minimize overproduction and markdowns. Next, the model of “sell what you create” should move toward “create what can be sold”. This model yields higher full price sell-through rates and less overstock. Driven by the traditional fashion calendar, the industry typically places high-volume orders well in advance, but supply too often exceeds actual demand. The consequence: large quantities of clothing are heavily discounted. Many shoppers now expect and anticipate those markdowns, which in turn effectively invites them to over-consume. Fortunately, many sophisticated tools are now available to fine-tune demand forecasts. Other consumer goods categories use predictive analytics based on big data and customer relationship management technologies to optimize assortment creation. Some small brands are built on the concept of ensuring that the firm’s supply exactly matches demand in the form of pre-orders from customers—one-two thirds for instance, which bundles orders by consumers and only then places its production order in the respective size. Amazon is showing how to drive this principle further with a recently filed patent for an ‘on-demand’ factory. An algorithm collects orders and coordinates them in the most efficient way possible, based on needed materials or manufacturing processes. Such a factory would produce only according to individual orders exactly matching demand and minimize inventory—very different from fashion’s current approach.
Disruptive Actions:
Offer to a “Segment of One.” The ultimate goal is prediction algorithms for true segment-of-one markets by product type, style, size, and so on, to “create what people want.” By using artificial intelligence beyond current forecasting methods, fashion brands can “know what a consumer wants before he or she knows it.” Optimized offers, driven by algorithms matching individual style and fitting needs, will better satisfy consumers and lead to longer use of products, reducing consumption and waste. Some companies have already taken steps in this direction, moving toward ‘codifying’ design. Stitch Fix sends clients five curated pieces of clothing monthly, based on data gleaned from Pinterest, customer surveys, and personal notes to stylists. As the client answers questions or communicates with a stylist, the algorithm improves its predictive power further.127

Move toward automation at scale. Catering to individual consumers’ needs case by case requires efficient and speedy production processes. Manufacturing of apparel, footwear, and home textiles lags behind other types of manufacturing, making the industry a clear target for large-scale automation with an average labor productivity catch-up potential of 157% across Cambodia, Indonesia, the Philippines, Thailand and Vietnam compared to the average of their respective manufacturing sectors.128 Increased automation is a natural next step, albeit a disruptive and capital-intensive one for most manufacturers. (See Automation: The Opportunity). As has happened in many other industries, robots can take on tasks that are repetitive, or physically demanding, or hazardous. They also offer workers the opportunity to re-skill. Workers can move into machine monitoring jobs, or into calibrating and maintaining automation equipment, and effectively participate in the enhanced productivity through wage increases in the short- to mid-term.

There is a social catch: automation could lead to value migrating toward more technologically advanced countries. (See Automation: A Social Threat?) It may become economically viable for companies to move manufacturing from developing countries and thus closer to the consumer with shorter distances travelled and therefore reduced CO2 emissions. Manufacturers will no longer have to go to where labor is cheapest; they will become smaller, local, and highly configurable.

Automation: The Opportunity
There are plenty of natural incentives for fashion brands to extend automation. Robot costs are falling and technology continues to advance rapidly with such recent developments as specialized machines called sewbots. Selected innovations are being implemented, such as bonding/gluing techniques as alternatives to sewing, and computer-controlled tools for pattern making and cutting to get more from each area of fabric and to reduce leftover material. Sportswear brands are the front-runners with automation thus far. Adidas opened its SpeedFactory automated plant in 2016; North Face has its FuseForm production technique.1 Nike announced a partnership with high-tech manufacturing firm Flex1. But a bigger, more concerted, more disruptive push is needed. Manufacturing as a whole is undergoing a transformation; Industry 4.0 is the term used to describe the myriad changes coming, extending far beyond, say, robotics, to the Internet of Things, cognitive computing, and more. By 2020, 25% of manufacturing will be conducted by robots, eliminating one-sixth of labor cost, according to the World Economic Forum. The fashion sector can and must benefit too. The International Labor Organization estimates that sewbots could dramatically cut costs in China and Thailand; the ILO’s calculation is that by 2020, human labor may be up to 50% more expensive than sewbots in China.1

Automation: A Social Threat?

Automation Has Been Used in Manufacturing for Decades

Utilize 3D printing at scale. 3D printing also offers leap-forward gains to fast-paced fashion brands. It enables rapid prototyping, on-demand, segment-of-one products, and local production with no inventory, and no waste, among other benefits. Today 3D printing is more suited to limited scale than high volumes, and is still relatively expensive. It is better suited to hard products—jewelry and shoes—than to textiles. In terms of sustainability, what first comes to mind is preventing long product journeys from production to consumer and therefore avoiding greenhouse gas emissions. But the high temperatures now needed in the process strain the ecological footprint of production, and the environmental impact of materials has to be carefully assessed.

Many in the industry got their first glimpse of 3D printing’s potential in 3D-printed shoes now available from New Balance and Under Armor, but at very high prices. Adidas is making an additional attempt at making 3D printing available at scale through the testing of a fully automated 3D printing and robotics shoe factory (the Speedfactory) in Germany and is planning to open a second one in the US this year. This will enable quicker printing and robotics shoe factory (the Speedfactory) in Germany and is planning to open a second one in the US this year. This will enable quicker delivery due to the closer proximity to customers.130 Concerning 3D printing fabrics, TamiCare is one of the front-runners with its product CosyFlex™, which features a fully automated process without cuts and therefore no wasted fabric.131 Several startups are also working on 3D-printer-style knitting machines for fashion, for instance, Unmade132 and Kniterate.132

Rebalanced Industry Economics: Target 2030. Fair and equal pay to workers and skill development for all workers

The effects of this massive change in the workforce could be much more impactful than the automation in manufacturing that has already been under way for a long time. For further details, please consider reading the BCG perspective “Competing in the Age of Artificial Intelligence” (https://www.bcgperspectives.com/content/articles/strategy-technology-digital/competing-age-artificial-intelligence/)

Automation = Higher Productivity = Higher Value

Automation is set to disrupt many office jobs (such as maintaining robots onsite) or evolving industries that still require manual work (such as service jobs).

Relevant Questions

- How can the industry make 3D printing available at scale?
- What are the limitations of 3D printing at this stage?
- How can the industry ensure fair and equal pay for workers and skill development for all workers?
IT WOULD COST ONLY ABOUT €1.35 TO DOUBLE THE WAGES OF THOSE PRODUCING T-SHIRTS THAT RETAIL FOR €25 EACH
better living standards, cross-industry collaboration is needed. The first step toward paying all workers fair wages. In order to truly provide living wages to collaborate with suppliers in increasing costs of goods sold will skyrocket. But that’s where deeper levels of collaboration is critical as it provides workers with a platform for negotiation and furthers workplace dialogue and peaceful conflict resolution between workers and management—especially in countries where unionization is restricted by law.

Disruptive Actions:

Move to living wages. Brands in particular can step up to determine acceptable living wages in the nations where they have suppliers and then to enforce improved compensation. Admittedly, this is not a simple exercise; due to big differences from country to country in consumer price levels and many other factors, it can be hard to determine what a living wage truly is. To start off, fashion brands could leverage work already done on this topic by organizations such as the International Labor Organization, the Fair Wear Foundation, and the Clean Clothes Campaign.

Another difficult but crucial step: using agreed-upon data on what constitutes living wages to collaborate with suppliers in increasing compensation. The issue that comes immediately to mind, of course, is that costs of goods sold will skyrocket. But that’s where deeper levels of collaboration will be essential in order to improve productivity levels. That can happen through worker training, better worker attitudes when working conditions are improved, knocking down barriers to the flow of production information, and increasing support for investments in more efficient machinery—for example, loans at preferential interest rates. While some of these initiatives can be carried out by individual brands, the entire industry needs to commit in order to move the needle. This is especially true for smaller brands that only account for a fraction of their suppliers’ production capacity.

Change industry standards for mark-up structures. Rebalancing of industry economics also means changing mark-up structures. Such changes could be barely visible to the consumer; it should cost only about €1.35 to double the wages of those producing T-shirts that retail for €25 each. However, under current mark-up structures, where all input price increases are treated equally, doubling the wages of workers would be multiplied and the T-shirt might actually cost €6.75 more on the retail rack. (See Exhibit 30.) So what is needed is a business system that allows an additional consumer premium for higher wages to be passed on to workers in its entirety. That model calls for truly innovative thinking and breaking business practices in place for decades.

Exhibit 30  Effect of Markup Model on Final Retail Price

Current Industry Markup Structures: Leading to Disproportionate Price Increases

PROOF OF CONCEPT

How “Better Work” Increases Performance and Improves Workers’ Lives

As a partnership involving the UN’s International Labour Organization, Better Work aims at uniting diverse groups—governments, factory owners, unions, workers, and global brands.

Improved firm performance: Factories collaborating with Better Work were up to 22% more productive, and the average factory in Vietnam experienced a 25% increase in profitability. This is attributable to reduction in worker turnover and injury rates, improvements in balancing production lines, and increases in orders.

Benefits to workers, their families and communities: Across country programs the initiative was able to decrease the gender pay gap by up to 17% and reduce sexual harassment concerns by up to 18%. In Jordan, a 23% increase in the proportion of workers using remittances to educate children could be shown, reflecting a wider shift in how remittances are used: from debt repayment to investments in education, health, and nutrition.

Ensuring that the health and safety of all workers are protected is an area where strong collaboration between fashion brands and suppliers can make a large difference. There are already immediate actions that can be taken today.

Immediate Actions:

Implement supplier health-and-safety scoring. Fashion brands can add health-and-safety scoring to their sourcing-decision criteria. A balanced-scorecard approach—well established as a management tool—can be helpful here. It gives factors such as exposure to chemicals, availability of fire doors, and remediation for injuries in line with the ILO Employment Injury Benefits Convention, appropriate weighting alongside quality, cost, and morale.

Implement supplier health-and-safety scoring. Fashion brands can add health-and-safety scoring to their sourcing-decision criteria. A balanced-scorecard approach—well established as a management tool—can be helpful here. It gives factors such as exposure to chemicals, availability of fire doors, and remediation for injuries in line with the ILO Employment Injury Benefits Convention, appropriate weighting alongside quality, cost, and morale.

Ensure worker representation. An important step toward paying fair and equal wages to all workers in the fashion industry is to provide them with an opportunity to be heard. While individual brands will not be able to drive the necessary change at a global level alone, brands can contribute to empowering workers through ensuring that all suppliers have democratically elected worker representation.

Worker representation is critical as it provides workers with a platform for negotiation and furthers workplace dialogue and peaceful conflict resolution between workers and management—especially in countries where unionization is restricted by law.

Another difficult but crucial step: using agreed-upon data on what constitutes living wages to collaborate with suppliers in increasing compensation. The issue that comes immediately to mind, of course, is that costs of goods sold will skyrocket. But that’s where deeper levels of collaboration will be essential in order to improve productivity levels. That can happen through worker training, better worker attitudes when working conditions are improved, knocking down barriers to the flow of production information, and increasing support for investments in more efficient machinery—for example, loans at preferential interest rates. While some of these initiatives can be carried out by individual brands, the entire industry needs to commit in order to move the needle. This is especially true for smaller brands that only account for a fraction of their suppliers’ production capacity.

Change industry standards for mark-up structures. Rebalancing of industry economics also means changing mark-up structures. Such changes could be barely visible to the consumer; it should cost only about €1.35 to double the wages of those producing T-shirts that retail for €25 each. However, under current mark-up structures, where all input price increases are treated equally, doubling the wages of workers would be multiplied and the T-shirt might actually cost €6.75 more on the retail rack. (See Exhibit 30.) So what is needed is a business system that allows an additional consumer premium for higher wages to be passed on to workers in its entirety. That model calls for truly innovative thinking and breaking business practices in place for decades.

Source: Better Work
and delivery. Health and safety would become an explicit decision criterion ‘on eye-height’ with the others.

**Disruptive Actions:**

Realize industry best-practice safety levels. Front-runners in sustainability, have significantly cut the average number of recorded injuries in the industry at their factories.\(^{145}\) One way to support such steps is to cut the number of suppliers, which enables closer relationships\(^{144}\) and require source traceability and other guarantees to clearly prohibit subcontracting. Suppliers must develop capabilities through worker and supervisor training, in collaboration with factory managers. Such measures would not only improve working conditions and therefore brands, reputations and risk management, but can actually improve direct performance. (See How “Better Work” Increases Competitiveness and Workers’ Lives.)

Use technology to drive assessment of Occupational Health and Safety (OHS). According to technology providers, mobile applications already exists to help fashion brands identify, reduce, and prevent workplace hazards faster and on a greater scale. These new mobile applications combine social technology, gamification, and data-driven insights to improve users’ understanding and engagement with workplace safety. Instead of pen-and-paper methods of training and recordkeeping, an incident report can now be done using a smartphone’s GPS, camera, voice-recording, and texting capabilities to capture real-time data. Adidas’ initiative sends text messages to over 260,000 workers in 58 factories, representing around a quarter of its supply chain.\(^{145}\) For training purposes, a quick video of employees doing things correctly can be easily shared with other workers. Data collected can be fed into modeling programs, provide almost instant feedback to employees, fill out reports with a minimum of effort, and track leading indicators. The best of these new technologies go beyond just automating manual tasks to delivering value by driving new behaviors on the factory floor. Online social networks and focused member communities enable workers to share knowledge and learn from each other. Mobile phones today are relatively inexpensive and easy to use and even provide workers with anonymized data about working conditions to enhance visibility across global supply chains. Often an NGO is required to gather and process the data to ensure end-users’ anonymity and security.

**Advocacy of Human Rights:**

Target 2030: No human rights abuses and full rights advocacy.

**Immediate Actions:**

Ensure gender equality. Findings from a recent Better Work study demonstrate that workplace policies favorable to female workers give the business greater resilience, profitability, recruitment and retention.\(^{145}\) While there are promising developments, many challenges remain here for the industry with wage discrimination (see Chapter 1), sexual harassment, and lower quality of life for female garment workers. Sexual harassment often arises from power differences, misaligned pay incentives, and the high-pressure nature of garment work—and it undermines productivity as well as hurts workers.\(^{147}\) Female workers reported having less free time as they often bear the burden of the work at home in addition to their factory job. To increase gender equality fashion brands should, for instance, ensure that business partners have recruitment policies that guard against discrimination, harassment, and abuse. Also important are employment policies that prohibit discrimination, including against pregnant women, and encompass remediation plans.\(^{148}\) Brands can also prompt partners to offer flexible work options, and to report on the share of women among all employees and in management positions. Guaranteeing equal opportunities and improving employment conditions in general can further increase productivity. (See Investing in Workers’ Well-being Can Pay Off.)

Prevent child labor further upstream. According to the UN, the number of children engaged in child labor declined globally by one third from 2000 to 2012 (from 246 million to 168 million). Yet more than half of those remaining child laborers in 2012 (85 million) were engaged in hazardous work.\(^{149}\) A supply chain 100% free of child labor should be the goal of every fashion brand, but the risk of short-term and unsound solutions is high due to the complex, multilayered and fragmented supply chains of the industry. Fashion brands should work with governments to combat child labor while also understanding and supporting comprehensive, bigger picture strategies and delivery. Health and safety would become an explicit decision criterion ‘on eye-height’ with the others.

**Heath and Safety is an Area Where Strong Collaboration Between Fashion Brands and Suppliers Can Make a Large Difference**

Via the Internet of Things, an increasing number of devices and equipment are becoming connected to each other and to the internet, making it possible to transfer real-time data that can be used to drive insights and improve OHS programs. This could include notifications alerting workers when they enter areas with unique safety requirements as well as extracting data from equipment.
solutions that could include pre-competitive collaboration. According to the OECD there are significant gaps in legal frameworks and law enforcement capacity to prevent child labor in many garment-producing countries.\textsuperscript{105} The OECD encourages fashion brands to work at numerous levels, including increased worker and management awareness through training, establishing management systems, and helping address systemic and root causes of child labor (such as lack of access to education).

**Disruptive Actions:**
Realize same opportunities regardless of orientation, beliefs and background. Achieving equal opportunities at the workplace means safeguarding that no one is treated differently or less favorably because of characteristics that are not related to their merit or the direct requirements of the job. This goal is one of the UN’s Ten Principles of the Global Compact.\textsuperscript{106} Besides the already addressed topic of gender equality, discrimination includes sexual orientation, religious beliefs, social background, and disabilities as well as age and political opinion. The aspiration of equal opportunities is to be realized both in fashion brands’ own operations and their entire supply chain. Drafting and implementing anti-discrimination and harassment policies, as well as diversity and inclusiveness policies, is the first step, followed by requiring all commercial business partners to have at least clear anti-discrimination, harassment and abuse policies in place. But companies also need to actively promote equal opportunity. Employees’ awareness has to be raised so that incidents are avoided altogether or can at least be reported without concerns.\textsuperscript{107} In a concerted move, the fashion industry has to work together to have not just inclusive headquarters staff, but to realize equal opportunities along the supply chain.

**Consumer Engagement:**
Target 2030: Complete Customer information on a garment’s life cycle impact – environmentally and socially

One challenge inhibiting progress along a number of impact areas in the industry is the lack of transparency and traceability.

**Immediate Actions:**
Use common standard to assess and remediate sustainability performance. Many companies lack clarity about sustainability because there is so much “noise”: a plethora of well-meant initiatives that lack sufficient scale, a multitude of certificates, and scattered research. Brands interested in measuring their current performance and identifying the best path ahead lack a standardized methodology or framework. Existing tools are split between individual company efforts (such as Kering’s EP&L or Nike’s Manufacturing Index) and some ambitious multi-stakeholder attempts to fill that vacuum. This fragmentation calls for consolidation in order to channel money and effort at the most promising initiatives.

What is needed is a widely adopted global standard to performance assessment and sustainability reporting, so companies can measure their performance against industry benchmarks. This standard must have a crit-
dresses consumers in stores through tags, providing information on the properties and sustainability of the materials used. The brand reports that 83% of 1,000 interviewed customers felt it shifted their knowledge about the issues.

These types of campaigns are a helpful way of introducing the topic of sustainability to consumers and enabling them to participate in the broader sustainability effort. As an added benefit to retailers, collection boxes and campaigns may even be able to drive store traffic, as customers will need to visit the stores to donate the garments.

Implement wear and care instructions. The use phase is a large contributor to the overall environmental impact because washing, drying, and ironing are so water- and energy-intensive. Companies can help reduce the impact of the use phase through wear and care instructions optimized for low environmental impact, for instance through less frequent washing and washing at lower temperatures. Further, companies should highlight the urgency for repair versus discarding an item and include replacement buttons and yarn.

Eileen Fisher offers extensive step-by-step repair and care guides on its website, enabling consumers to follow instructions on topics ranging from “How to hand wash a sweater” to “How to sew a button.” Taking the initiative a step further, the company offers to repair customers’ garments free of charge; the customer simply has to take the item to the store and then wait eight to ten weeks.155

Disruptive Actions

Establish information labels. To encourage consumers to make more sustainable purchasing decisions and influence consumption patterns, large product labels on garments can be powerful instruments. Providing information on the environmental impact of a given product to consumers will help them understand the implications of their purchases. It can also become a competitive advantage if, for instance, the item is compared to an average product that does not use organic input materials or novel dyeing processes. A company pioneering in that regard is US fashion brand Reformation: It published environmental impact information for all its products on its website in terms of CO2, water and waste. It also compared the footprint of each garment with those of a comparable, conventional product.156

BY EDUCATING, INFORMING AND INCENTIVIZING CONSUMERS, COMPANIES CAN MAKE UP FOR CONSUMERS’ LIMITED AWARENESS AND WILLINGNESS TO PAY FOR SUSTAINABLE PRODUCTS

Building upon existing concepts such as environmental P&Ls and tools such as the Higg index, measuring the environmental impact of one’s products can be achieved in the near future by brands already reporting on the topic. For inexperienced brands undertaking this effort would also help them to better understand their own supply chains, as was concluded by 78% of participants in a French government pilot project on environmental labeling.154 Common labeling standards would facilitate consumer understanding. Such a standard seems within reach on the environmental front; more and more companies are making environmental impact assessments, with some, such as Kering, going so far as to lay open most of their methodology.157 The same cannot be said for social impact assessments. But standardized labels on working conditions in, say, garment factories, would help raise consumers’ attention to the impact of their choices.

Many emerging business models in the fashion industry circle around the idea of prolonging the life of a garment, be it through reuse or increased durability. Such business models can complement existing models or form the basis of a company in its own right. One novel concept promotes consumer access over ownership. Such models can be based on renting clothes rather than purchasing them, at 10% to 15% of their purchase price, or even a Netflix for clothing model where consumers get access to unlimited items, three of which they can hold at a time, based on a monthly subscription fee.158 As a consumer’s wardrobe life-cycle manager, the subscription business model can reduce production while satisfying consumers’ need for novelty. (See Novel Business Models at Filippa K.) Admittedly, individual transportation and possibly cleaning after every use could blunt some of the environmental advantages.

Sharing models, boosting the secondary use of products, or promoting repair, can reduce the industry’s environmental impact, but they still have to prove their economic viability on the large scale. A major obstacle is the lack of consumer demand: 90% of consumers in EU countries do not consider buying secondhand clothing at all.159 But as examples from other industries show—think Uber and Airbnb—there could still be a vast opportunity. Imagine telling someone 10 years ago that soon, millions of people would regularly share rides with complete strangers and stay in apartments of people they have never seen before—and pay for such services.

Novel Business Models:

Many emerging business models in the fashion industry circle around the idea of prolonging the life of a garment, be it through reuse or increased durability. Such business models can complement existing models or form the basis of a company in its own right. One novel concept promotes consumer access over ownership. Such models can be based on renting clothes rather than purchasing them, at 10% to 15% of their purchase price, or even a Netflix for clothing model where consumers get access to unlimited items, three of which they can hold at a time, based on a monthly subscription fee.158 As a consumer’s wardrobe life-cycle manager, the subscription business model can reduce production while satisfying consumers’ need for novelty. Imagine telling someone 10 years ago that soon, millions of people would regularly share rides with complete strangers and stay in apartments of people they have never seen before—and pay for such services.

PROOF OF CONCEPT: Novel Business Models at Filippa K

Filippa K is a brand that is considering business model innovation to emphasize its devotion to reduce, repair, reuse, and recycle. To ensure that all the company’s products receive a second or third life through reuse, the company has operated a profitable secondhand store in Stockholm since 2008. Further, the company has started to rent out clothes in selected stores through its Lease concept. This concept builds on the idea that customers will be able to renew their wardrobes without contributing to increased consumption.

Source: Company information
SUSTAINABILITY IS A POSITIVE BUSINESS CASE

The preceding assessments show that the industry can already generate immense value for the world economy through better practices. The company examples showcased in chapter 3 are proof-of-concept that such improvements can also be economically viable to individual businesses. In its 2015 survey report with MIT Sloan Management Review, BCG found that 60% of managers in publicly traded companies believe that good sustainability practices influence business decisions.160 This stands in contrast to the 75% of senior executives in investment firms who consider a company’s sustainability performance to be materially important for their investment decisions—and nearly half who would not invest in a company with a poor track record in that regard.161 Furthermore, 75% of investors now think that increased operational efficiency often accompanies sustainability investments.162

GFA and BCG aim to assess how far these moves towards improved impact can be profitable, or at least not generate additional costs, besides not consider additional costs. At least the company examples mentioned already, we can point to several measures with neutral to positive business cases, based on initial estimates built on available data and ambitious, but reasonable assumptions.

These calculations were performed for investments to boost efficiency in waste and water management, and to improve labor productivity, for an exemplary fashion brand. With waste reduction, the measures included supplier training to lower processing waste, wider use of laser cutting to lower manufacturing waste, and new apparel designs that cut down on waste on day one. Water-saving measures included supporting suppliers in adhering to the Better Cotton Initiative’s principles. Measures for productivity included training of factory managers, efforts to change workers’ attitudes and improve working conditions, streamlining line-level productivity, and removing information barriers to sharing best practices.

More extensive estimations were made on energy efficiency, which has special significance for fashion brands due to the high energy costs on yarn processing, polyester production, and store occupancy. These investments can reach break-even quickly and even increase EBIT-margins. (See Exhibit 31, Energy Efficiency Reducing Emissions While Enhancing the Bottom Line.) For an exemplary company, comparable to a typical large-scale fashion retailer, break-even would come within a few years and the EBIT-margin could be improved by one percentage point.

These assessments, along with the multitude of proofs of concepts outlined in Chapter 3, show that improving a fashion brand’s impact need not come at the detriment of profitability—and this is without calculating the positive effect on risk management and brand building. More work is to be done on a broader, more detailed set of concrete examples. Such work, to be released in a future edition of the report, will include partnerships with sustainability frontrunners to analyze in depth the short- and long-term effects of these investments. All of these investments can help counteract the cost pressures faced by fashion brands that were described in Chapter 1. But uncertainty prevails and even greater cost increases are possible, if for example policymakers move toward special taxes to enforce lower resource use. This is why the industry needs disruptive new technologies and business models as well as collaborative improvements. These would keep businesses the driving force in the industry, supported by policymakers instead of restrained by them.

### Exhibit 31 Exemplary Business Case for Energy Measures

- **Tier 2 Supplier**
  - The production of fabric from raw material is the most energy-intensive production step in the fashion value chain, driven by amongst others cotton spinning and weaving or polyester esterification spinning and knitting.
  - As illustrated in the model P&L, fabric cost is often by far the greatest cost factor in the cost of goods sold; therefore, measures increasing energy efficiency in this production step have the greatest impact.
  - **Examples of possible efficiency drivers:**
    - Update suction fan drive control systems
    - Utilize heat energy of exhaust gases
    - Install variable frequency drives for humidification system pumps
  - In total, those and other energy efficiency increasing measures are estimated to reduce energy consumption by 32% in applicable facilities.
  - 80% was assumed as a share of applicable facilities. Tier 2 supplier facilities are often located in countries such as India or Bangladesh where many are still equipped with outdated machinery showing the highest savings potential.
  - **The investment mainly entails cost for upgrad- ing the equipment for every facility; due to a generally large number of supplier facilities, the capital requirement is large.**
  - Furthermore, cost for capacity building, i.e. training of workers, has to be taken into account, although in much smaller dimensions.
  - Due to the big share of the considered cost items in the overall cost of goods sold, and therefore the cost savings, the investment is calculated to break even within 1-2 years.

- **Tier 1 Supplier**
  - In Tier 1 factories, being responsible for the manufacturing of the garments, energy is a considerable input factor; however not as large as in Tier 2.
  - Furthermore, factory running cost are only a marginal share of overall production cost; therefore, energy efficiency measures in this production step only have very limited impact.
  - **Examples of possible efficiency drivers:**
    - Install Variable Speed Drives for sewing, washing, dyeing machines
    - Switch to LED lighting
    - Use new, more efficient screw type compressors
  - In total, those and other energy efficiency increasing measures were estimated to reduce energy consumption by 26% in those facilities applicable.
  - 90% was assumed as a share of applicable facilities. As Tier 1 Tier supplier facilities are often located in countries such as India or Bangladesh where many are still equipped with outdated machinery showing the highest savings potential.
  - **Again, the investment includes cost for equip- ment and capacity building.**
  - Capital requirements are, however, considera- bly smaller than in the case of Tier 2 suppliers with also less facilities to upgrade overall.
  - Nevertheless, due to the limited cost saving impact, the time needed to break even on that efficiency measure is calculated to be between 3 and 4 years.

- **Own stores**
  - As outlined in the model P&L, store occupancy costs generally make up a large share of SG&A costs, roughly on par with labor and G&A expenses.
  - Within the store occupancy costs, energy costs make up a rather small but still considerable part of the total costs; within energy costs, especially lighting makes up a major part. Measures in this area can therefore have a viable influence on the bottom line.
  - **Examples of possible efficiency drivers:**
    - LED lighting requiring less direct energy
    - Switch of lighting reducing necessary room cooling energy
    - Slowing down day/night and occupancy sensors
  - In total, such energy saving measures are esti- mated to save nearly 25% in energy costs.
  - Based on similar store concepts in all outlets, the measures are assumed to be rolled out in all stores of the model company.
  - Upgrading for instance the lighting in stores requires adaptations in all retail outlets but can be realized with comparably low capital requirements, due to standardized easily scalable technology solutions and installation processes, however still leading to direct cost savings.
  - For the model company, the investments breaks even within around 1 to 2 years.

The Landscape for Change is bold and ambitious, going well beyond what individual players have accomplished thus far and can accomplish going forward. The main challenge to achieve this ambition is not individual commitment and actions, but leadership, collaboration and innovation. How can the industry manage the collective effort to develop new solutions and scale promising technologies to commercial viability? Many of these ideas will become practical only with widespread adoption. It’s not enough for a few leading brands or sustainability champions to show proof of concept. We need the broad commitment and coordinated participation of the industry as a whole. With help from industry associations, consumers, and regulators, fashion can achieve the vision of a better industry.

**WHAT IS THE ROLE OF REGULATORS?**

Governmental regulators can play several roles in their interactions with the industry, along with international organizations such as the United Nations, the EU, and ASEAN, and their actions will depend on the industry’s own course. The best result is for regulators to offer a globally harmonized approach.

Outside of laws on wages and chemical use, the fashion industry so far has seen little regulatory intervention. This is due partly to a lack of regulation generally in the main producing countries. Some initiatives have emerged from voluntary action, such as Bangladesh’s Accord on Fire and Building Safety, which is legally binding for participating parties. The UN Global Compact, in which firms pledge to observe proclaimed standards, is another example.

This voluntary self-regulation of the industry may change—and change quite suddenly—if the industry finds itself blamed for sustainability shortfalls. To avoid unilateral regulation, it is incumbent upon the industry to regulate itself.

**THE REGULATOR AS AN AMPLIFIER**

By taking the lead, the industry can favorably steer the needed changes. Not only would it preempt unilateral restrictions, but it could prompt supportive regulation that reinforces sustainability targets and incentivizes change. Rather than setting out mandates, regulators can motivate and amplify the moves of farsighted companies. They can do this, for example, with incentives for renewable energy or tax discounts for repairs. (See Exhibit 32 for an overview of the broad-solutions landscape envisioned for regulators).

Going further, governments can push the technological frontier with public research grants or subsidies on company- or industry-wide R&D, for instance on sustainable materials or chemical recycling. They can also subsidize investments to match production with demand, as in big data, 3D printing, and large-scale automation.

With fashion lagging behind other industries on recycling, policymakers should make it easier to handle clothing waste. They can help make consumers aware of the end-of-life stage and existing collection options as well as simplify the collection process. Regulators can also awaken con-

¹Non-exhaustive landscape—to be collectively expanded

Exhibit 32 Guide for Regulatory Action—From Amplification to Strong Regulation

Magnitude of collaboration and innovation  
Low

Preferred scenario (ideally on a harmonized global level)

Possible scenario if business do not act

Influence on Consumers, not businesses

Influence on Non-exhaustive landscape—to be collectively expanded
The pharmaceutical industry has found, damage the industry’s profitability.

As for the social footprint, regulators can support better labor practices with tax incentives or direct financial support for worker safety training programs and improvements in factory conditions. They can help invest in company health services for workers in production countries, help define the living wage, and support collective bargaining.

In all of this, regulators should be aware of the differences in sustainability maturity and available resources across the industry. Brands about to embark on the journey face a business reality different from that faced by front-runners with dedicated efforts well under way. Legislation has to reflect these distinctions to support efforts without imposing unmanageable cost on resource-constrained firms.

**IF REGULATORS STEP IN**

If the fashion industry fails to take the proactive, concerted stance needed to boost sustainability, regulators may take on more than just supporting and amplifying roles. They could take the lead — and as the pharmaceutical industry has found, damage the industry’s profitability.

Potential steps range from mandates on renewable energy to compulsory labeling for environmental life cycle assessments and social impact — as was piloted with the Grenelle 2 Act in France; or more broadly in the European Commission’s “Environmental Footprint” pilots in 26 consumer product categories. Regulators could set far-reaching and escalating targets for the industry, with penalties becoming more severe over time.

Other laws might set maximum levels of water and chemical use, as is already the case in drought-stricken regions. Or governments might compensate, through taxes, for the mispricing of water by factoring in the negative side effects of its unconstrained use, comparable to the way carbon taxes are used today.

Governments could even mandate “extended producer responsibility” — forcing brands to take in products they sold when consumers return them at end-of-life, as they have already done in many countries with electronics.

Regulators may impose limits on the use of virgin raw materials. Fashion brands that are not yet using low-impact materials, and have no established relations with suppliers of such materials would struggle under such regulation.

On the social side, regulators could start with stricter enforcement of minimum wage levels and escalate to raises in those levels. Labor-relations rulings could drive systems for determining and negotiating living wages. Policymakers could also implement a standardized global health-and-safety auditing process. At a minimum, it might set protocols for unannounced audits and restrictions on the choice of auditors. The European Commission is currently working on the ‘EU Garment Initiative’, aiming for responsible management in the supply chain of the garment sector.

Regulators might also force fashion brands to stipulate community investments, such as the minimum percentages of sales allocated to projects that benefit workers at their factories. Or it could insist that foreign direct investments have a minimum level of community investment in, say, the health infrastructure for garment workers.

These are not hypothetical possibilities. There is a growing political will at least within the European Union to regulate the fashion industry. Initiatives in Germany, the Netherlands and elsewhere have gained momentum among policymakers in response to what they see as the industry’s lack of self-governance of supply chains. Such national initiatives could potentially undermine the all-important efforts at global consolidation and harmonization. To head these off, it is imperative for the industry to develop and showcase large-scale improvements.

**THE BEST RESULT IS FOR REGULATORS TO OFFER A GLOBALLY HARMONIZED APPROACH**

Consumers are far more sensitive to environmental, social, and ethical concerns than those of previous decades. A third of Millennials strongly agree that they are more likely to buy from companies that are mindful of their social responsibilities, while just a quarter of those older than 51 say so.

But only a tiny proportion of fashion shoppers are willing to pay a premium for sustainable products. In the Pulse Survey only 6% of the fashion brands polled said they charged a substantial premium for products explicitly marketed as sustainable. One in four firms named consumers’ unwillingness to pay such a premium for preventing them from revising their practices. At the same time, most consumers have, at best, a hazy idea of what goes into their buys. While some may be attuned to fair-trade sourcing of the materials that go into a desired blouse or jacket, they may know little or nothing about the impact of the dyeing processes used in making the product. They may also be blind to their own participation when quickly disposing of the apparel after only a few years.

Additionally, consumers who want to make informed decisions about their fashion purchases are hard-pressed to sort through the information available to them. Here lies opportunity for the industry. Farsighted fashion brands can join forces with consumers in a long-term push for better practices and transparency in the value chain.

Next to making conscious choices about their consumption patterns, consumers can most easily make a difference in their apparel use. By upgrading washing and drying machines to eco-efficient models, as old machines break, they can save a great deal of water and energy. As for disposal, they can help by donating used garments through in-store collection boxes or public collection schemes.

With education, information, and incentives, consumers can gradually change their habits far beyond washing and drying.
COLLABORATION AND INNOVATION NEEDED ON AN UNPRECEDENTED SCALE

Up to now, individual brands and retailers and selected multi-stakeholder initiatives have shown impressive commitment and have already achieved great progress. Best practices are available across all segments of the industry, and substantial innovations are emerging. Applying and implementing these will do much to improve the industry’s impact. But these will not be enough to capture the full potential outlined in Chapter 1. A collective effort with critical mass would enable the industry to make progress on the major pre-competitive goals, such as a network of collection points to promote recycling.

Such an effort would need a unified agenda with clear goals. It would be led by the large industry brands which as we have shown in Chapter 2, are clearly ahead of the game when it comes to sustainability. (See A Common Global Agenda on Sustainability in Fashion). The key is to set up an ecosystem that encourages all parts of the industry to collaborate on the major issues. Multi-stakeholder initiatives, acting beyond commercial interests, can offer guidance and promote cohesion. But today’s scattered, fragmented array of initiatives, memberships, certifications and so on can be confusing to brands, suppliers, innovators and donors. Consolidation is inevitable to focus time, energy and money.

With the industry united around an agenda for change, it can drive the needed systemic change and work jointly on disruptive innovation. (See Changing the Apparel Industry through Innovation and New Business Models.) As promising ideas emerge, companies can support pilot programs and then quickly scale them up to commercial viability. Such collective investments would drive down costs and enable the magnitudes necessary to ‘move the needle’—as can be seen in other industries where such practices are common.

FOR A WORLD BEYOND NEXT SEASON

This report has laid out the scale of the challenges and broken down the necessary responses, near-term and further out as well as individual and collective. It has advanced the business case for change and estimated the upside of the appropriate responses. It has also sketched out one scenario where the industry acts proactively and forcefully, and a fallback case where regulators drive more of the change. We vigorously recommend the first scenario, in which fashion businesses take the driver’s seat in making smart choices for the benefit of businesses and the world economy.

In preparing and producing this report, GFA and BCG have signaled the urgency and hidden potential of the sustainability issue and shown a light on practical ways forward. It is our hope that the report becomes a powerful catalyst for real change. As such, the Good Citizen Principles and the Landscape for Change provide concrete recommendations grouped by different maturity phases. More broadly, GFA and BCG wish for this report to spark myriad conversations among many different parties that will collectively galvanize change at scale. We hope to continue this conversation in future reports, with input from all interested stakeholders.

Since its beginning—certainly since the development of mass-fashion markets—the fashion industry has always had its eye on the clothing lines to be launched next season. In the context of a world timed by seasons altered already by the heavy hand of humankind, the industry must now look still further forward.

40 The estimated environmental footprint builds on (1) an estimation of the environmental footprint along the entire value chain by fiber type, and (3) an estimation of total consumption in million tons and scaling the footprint. For additional details, please see the methodology appendix.

42 The sample includes Cambodia, India, Indonesia, Lao PDR, Pakistan, and Vietnam. The International Fertilizer Industry Association (IFIA) has estimated that the average minimum wage is weighted by the total of wage and salaried employment in apparel and footwear, and road freighter and textile in each country. Data based on Huynh, P., Cowgill, M. (2016). Weak minimum wage compliance (ILO Asia-Pacific working paper 2016).

58 The estimated environmental footprint builds on (1) an estimation of the environmental footprint along the entire value chain by fiber type, and (3) an estimation of total consumption in million tons and scaling the footprint. For additional details, please see the methodology appendix.

Forecasting the P&L of an Exemplary Fashion Brand

B

PAGE 131
Environmental footprint projection
The profitability at risk for businesses is based on a projection of the profit-and-loss statement of an exemplary fashion brand. The P&L is projected for a base case that assumes conservative fashion growth and for a high case that assumes high costs for energy, wages, and water.

Total revenues of the exemplary brand are projected to grow at the same rate as the retail value of the total apparel and footwear market, estimated at a real rate of 2% per annum between 2015 and 2030.

(See Exhibit A1)
However, while the overall retail value for apparel and footwear is projected to grow, the retail volume growth is projected to outpace it. As a consequence, the margins of fashion brands will come under pressure as average per item prices continue to fall. (See Exhibit A2.) On a more positive note, the decline in average per item prices appears to be slowing down.

### Exhibit A2

Exhibit A4

A Number of Sources Contribute to the Estimation and Forecast of the Exemplary P&L – The Base Case

Exhibit A5

Fashion Companies Face Rising Costs of Raw Materials and Labor – The High Case

While the base case projection is built on realistic and conservative estimates, GFA and BCG also calculated the impact on the P&L in the case of high energy, high labor, and high water growth scenarios. Exhibit A5 provides a detailed overview over the high case results, including margin assumptions and the magnitude of the individual line items as well as the CAGRs for the entire period.
Exhibit A6 outlines the sources used to project the high cases for each of the chosen high cost case areas. The high energy price and high wage cases are based on year-by-year high case growth rates, modeling the case of high oil prices and the case of continued historical growth in labor cost in the primary textile industry. The high water price case is built on the assumption that in the future, the negative externalities of water to the world economy may be factored into the cotton price, increasing its cost to the exemplary company. This price increase may be the result of regulators introducing a water tax similar to carbon taxes common today in many markets.

<td>38%</td>
</tr>
</tbody>
</table>

To make the effect of the high cases on the various line items transparent, Exhibit A7 outlines the effect of each case on each line item that is influenced by that cost. The comments outline the share of the cost factors in each line item. Further, the last two columns to the right show the total growth of the line item in the base and high cases, highlighting the magnitude of the high cost cases. For instance, the total fabric cost between 2015 and 2030 increases 65% in the high case, up from 23% in the base case. The impact of the high case on the exemplary line item is twofold. First, there is a direct impact on the 9% of fabric cost directly attributed to energy (for example, through the use of spinning machines). Second, there is an indirect impact on the 55% of fabric cost attributed to polyester, as the polyester price closely follows the price of oil.
In summary, in the high case, the EBIT-margin has 17.5 percentage points at risk until 2030. The increase from the base case of 14.1 percentage points at risk is contributed by a 9.1 percentage point increase from energy, a 2.1 percentage point increase from wages and a 2.2 percentage point increase from water. The remaining 0.8 percentage points stem from an amplification effect when combining all three high cases. (See Exhibit A8.)

While it is unlikely that the full high case will become reality in the near future, it is not difficult to imagine that a number of input factors will become more expensive as the supply of natural resources becomes increasingly scarce and the cost of labor grows as workers are paid fairer wages.

Exhibit A8  The High Energy Cost Scenario is the Main Driver of Additional EBIT-margin at Risk in the High Case

The high case places an additional 14.1 ppts. at risk with the majority of the impact attributed to high energy costs...
The projected environmental footprint in 2015 for each impact area builds on the following analysis.

1. Triangulation of the fiber mix in 2015 and the projected fiber mix in 2030 if we continue business as usual
2. Estimation of the environmental footprint from cradle to grave by fiber type
3. Estimation of the total consumption in millions of tons and scaling the footprint

In this section, the three steps are examined in more detail.

1: Triangulation of the Fiber Mix in 2015 and the Projected Fiber Mix in 2030 If We Continue Business as Usual

The overall fiber mix for the fashion industry is based on a triangulation of, among others, Textile Exchange (2016), Lenzing (2016), Dibdiakova and Timmermann (2014), and CIRFS (2017). The fibers were allocated to the following four categories: synthetics/polyester (including other synthetic manmade fibers), cotton, viscose (including other cellulosic manmade fibers), and wool.

Through this triangulation, the fiber mix in 2015 is estimated to be 64% synthetics/polyester, 28.5% cotton, 6% viscose/cellulosic fibers, and 1.5% wool. In general across sources and research, the existing forecasts of the shares of wool and viscose are stable across sources, while the approximated split between cotton and polyester tend to vary more with a range of 25% to 38% for cotton and 55% to 69% for polyester.

Suggested growth rates for 2015–2020 are 3% to 4% for synthetics/polyester, 1% to 2% for cotton, and 5% to 6% for viscose/cellulosic fibers. It is assumed that, as a natural fiber, wool will grow at the same rate as cotton. Further, growth rates are assumed to remain stable between 2020 and 2030.

By applying the expected growth rates to the triangulated fiber mix in 2015, the fiber mix in 2030 is projected to be composed of 68% synthetics/polyester, 22.5% cotton, 8.5% viscose/cellulosic fibers, and 1% wool.

2: Estimation of the Environmental Footprint from Cradle to Grave by Fiber Type

To reflect the differing environmental footprints across fiber types, the footprint is calculated for each impact area for each of the four major fiber types (synthetics/polyester, cotton, viscose/cellulosic fibers, and wool). The analysis considers the entire value chain from cradle to grave, reflecting the full impact of a given fiber.

The final footprint for each fiber type throughout the value chain is based on a BCG triangulation of, among others, WRAP (2012), van der Velden et al. (2013), and Kirchain et al. (2015).

Uncertainties are inherent in any type of LCA analysis for the fashion industry. As also emphasized by Thinkstep, there are usually large variations in LCA data. For instance, the results for almost all environmental...
impact categories can vary as much as 60% for cotton at the gin gate, where the cotton is dried, cleaned, and compressed into bales. Further, for both synthetic and cotton fibers in the fabric production phase (from fiber to fabric), the results show a deviation of more than 50%. Additionally, the magnitude of impact of the use phase may be overstated in research, leading to lack of focus on other areas of the value chain. Contrary to this effect, impacts of indirect activities in other phases of the value chain may be overlooked or understated, which again can overemphasize the use phase.

3: Estimation of Total Consumption in Millions of Tons and Scaling the Footprint

As a final step, the consumption of apparel and footwear in 2015 and 2030 in millions of tons is estimated. The approximation builds on a BCG triangulation of bottom-up and top-down analyses. The bottom-up methodology is based on projected consumption of apparel and footwear per capita split by advanced and developing economies. The projections are subsequently scaled by population projections and estimates of the number of items per kg of apparel and footwear.

The result of triangulation across sources and methodologies is consumption of 62 million tons in 2015 and 102 million tons in 2030, corresponding to total growth of 63% and a CAGR of 3%.

In a final step of the analysis the environmental impact by fiber type is weighted with the projected fiber mix shares to then scale the weighted footprints by total consumption in millions of tons.
